DTRC ISSUES THREE TYPES OF REPORTS:

1. **DTRC reports, a formal series**, contain information of permanent technical value. They carry a consecutive numerical identification regardless of their classification or the originating department.
2. **Departmental reports, a semiformal series**, contain information of a preliminary, temporary, or proprietary nature or of limited interest or significance. They carry a departmental alphanumeric identification.
3. **Technical memoranda, an informal series**, contain technical documentation of limited use and interest. They are primarily working papers intended for internal use. They carry an identifying number which indicates their type and the numerical code of the originating department. Any distribution outside DTRC must be approved by the head of the originating department on a case-by-case basis.

Abstract

The Air Force is developing a specification for managing technical information concerned with weapon system maintenance and operation. Their aim is to ensure that this technical maintenance information is up-to-date, accurate, readily accessible, and in easy-to-use digital form.

The Army is the lead service in implementing the MIL-STD-1388 standard. The implementation of this standard will provide an integrated data base consisting of source data upon which technical maintenance information is based and supported

The benefits of integrating these two closely related databases are considerable. This report first evaluates these two independently developed databases and then proposes an integration strategy. (S)

Administrative Information

The Advanced Information Systems Branch (Code 1226) of the Communications and Information Systems Division at the David Taylor Research Center (Carderock) proposed and completed this work. It was sponsored by the Integrated Maintenance Information System (IMIS) program (PE 63106, Project 2950) and managed through the Air Force Human Resources Laboratory. This work was performed under DTRC project number 1820-006, and its DTRC program number was N00167-90-M-6183.

The opinions expressed in this report are those of the author. They do not necessarily reflect the views of the Department of the Navy.

Executive Summary

Computer-aided Acquisition and Logistic Support (CALS) is a joint DoD and industry initiative to facilitate the integration of digital technical information for weapon system acquisition, design, manufacture, and related support functions. Phase II of CALS will fully integrate various independent technical functional capabilities and parallel processes. Their integration will result in considerably enhanced productivity and improved readiness for weapon systems.

In Phase II of CALS, the concept of technical information integration will include the logical collection of shared data models (or physical databases) to support all users of these technical information systems. Data dictionaries which conform to information resources dictionary standards (incomplete at the present time) will be used to produce, manage, and integrate the data models which define the required technical information for weapon systems.

To this end, the Air Force is developing the Content Data Model (CDM) which is a specification for a data base. The CDM is intended to store all of the technical maintenance information for a weapon system in digital form.

The Army is also implementing the MIL-STD-1388-2B standard which defines the requirements of Logistic Support Analysis Record (LSAR) in support of weapon system acquisition and maintenance programs. LSAR is an integrated relational database supporting technical maintenance tasks.

Much of the CDM source data for technical maintenance information should be derived from logistics analysis data such as that provided by LSAR. The integration of LSAR and CDM data will greatly enhance quality and productivity of technical manual development.

Since the CDM specification and MIL-STD-1388-2 were developed independently, they are not compatible with each other. This project was first intended to develop a data dictionary for CDM using the PC-IAST CASE tool which is based on the NIAM binary relationship modeling technique. The PC-IAST tool does not conform at present to the IRDS standard. However, the NIAM method was chosen because it offers a comprehensive set of features suitable for building data models. When this project began in the spring of 1990, there were no CASE tools conforming to the IRDS standard.

The data elements of the CDM and MIL-STD-1388-2B data dictionaries were examined at length. Suggestions for improving compatibility at the data element level are contained in the Appendixes J, K, and L.

Finally, procedures are proposed for developing a prototype integration of a subset of MIL-STD-1388-2B and CDM at the data schema level. The experience gained in integrating these two CALS databases will be crucial in the future development of IWSDB and in planning their integration on a large scale basis, as well as in the development of the IRDS standard itself.

1 Introduction.

For some time, the Air Force has been developing systems and procedures for maintaining technical information for weapon system maintenance and operation to ensure that this information is up-to-date, accurate, and readily accessible in digital form. To this end, the Air Force Human Resources Laboratory (AFHRL) is developing the Content Data Model (CDM) (see Sections 2.1.g and 2.1.j) which is a specification for a database. The CDM defines the logical structure for a revisable and format-free database of integrated technical maintenance information.

The Army is the lead service in implementing the standard MIL-STD-1388-1, requirements for a Logistic Support Analysis (LSA) (see Section 2.1.a) task, and standard MIL-STD-1388-2, requirements for a Logistic Support Analysis Record (LSAR) (see Section 2.1.b) in support of weapon system acquisition and maintenance programs. The resulting LSAR is a logically integrated data base consisting of source data upon which technical maintenance tasks are based and supported.

Clearly, much of the source data of CDM for technical manual (TM) development should be derived from logistics analysis data such as that provided by LSAR. It should be relatively easy to realize the linkage between LSAR and CDM data bases. The database integration between LSAR and CDM should greatly enhance quality and productivity of TM or CDM development.

1.1 Purpose.

Since the CDM specification and MIL-STD-1388-2 were developed independently, they are not compatible with each other at the present time. The purpose of this project is to first analyze these two data standards at the data element level and then to propose a strategy for integrating them.

1.2 Scope.

The scope of this project was first to analyze the CDM by developing a data dictionary and then to assess the compatibility of the CDM data dictionary with that of MIL-STD-1388-2B. Currently the software standards and CASE tools are not mature enough to support a full-scale integration of data dictionaries. This project proposed a strategy for prototyping the integration of a subset of MIL-STD-1388-2B with CDM.

1.3 Structure of This Report.

Figure 1 outlines the structure of this report. Sections 1 through 4 and Appendixes A, B, and C are introductory. Section 2 lists the documents referenced in this report. Section 3 consists of the Glossaries and Definition of Terms. Section 4 discusses four topics which constitute the basis for this report.

Section 5 is the major section of this report. It develops a data dictionary (CDM/NIAM) for CDM which does not conform to the IRDS standard. The Personal-Computer Information Analysis Support Tool (PC-IAST) (see Section 2.2.a), a proprietary product of the Control Data Corporation which is based on the Nijssen Information Analysis Method (NIAM), was used for the development of the CDM/NIAM conceptual schema (see Appendix E) and the CDM/NIAM data dictionary (see Appendix F). The CDM specification (see Appendix D) was used for defining the input requirements in the development of the CDM/NIAM data dictionary. Appendixes G, H, and I contain outputs generated by the CDM/NIAM data dictionary. More detailed descriptions of Boxes II, III, IV, VIII, IX, X, and XI in Figure 1 can be found in Section 5.

Section 6 and Appendixes J, K, and L describe the assessment of the data elements of both CDM/NIAM and MIL-STD-1388-2B and then propose the prototype integration of these two data dictionaries. The recommendations for the integration of these two data dictionaries are summarized in Section 7.

The style and format of this report follow those of the "CALS Program Implementation Guide" (see Section 2.1.e).

See "Glossary" used in this report appearing in Appendix A.

See "Definition of Terms" used in this report appearing in Appendix B.

4 Automation and Integration.

The amount of technical and logistical information required to support modern, technologically advanced weapon systems has increased dramatically in recent years. The systems used to originate, process, store, and transfer this technical and logistic information are primarily paper-based systems. In an attempt to diminish the impact of this mass of paper associated with a given weapon system, many selected functions critical to weapon system development and readiness have been automated. These automated support systems are evolving as distinct islands of automation. Though many of these islands of automation may not be compatible, the

benefit of continued investment in automated information systems to reduce paper is obvious. Clearly a greater payoff will be realized if these islands of automation are integrated. This becomes the basis for the DoD and industry joint initiative of the CALS program. The mission of CALS is to support the transition from the current paper-intensive weapon system design, manufacture, and support processes to a largely automated and integrated mode of operation.

CALS implementation is organized into two overlapping phases. Phase I of CALS focuses on converting current paper flows to digital form in a file transfer format (see Section 2.1.c) while Phase II of CALS targets new functional capabilities that will be achieved through integration and consolidation of the numerous parallel or duplicative processes and functions. These efforts will fully integrate logistic support into the product data design process consistent with concurrent engineering practices and will link logistics data products (e. g., technical publications, provisioning documents, and training manuals) with product definition data (PDD). This integration will produce large savings through increased productivity and will result in improved readiness through much improved planning and support. Fig. 2 shows one way to integrate the PDD, LSAR, and logistic databases throughout the weapon system life cycle phases. Most of the PDD and LSAR data for a weapon system is developed in the Full Scale Development phase. The PDD and LSAR data is the primary data source for the logistics data bases development. The feedback obtained from the logistics databases during the system operation phase should be used to enhance the reliability and maintainability of the weapon system.

The CALS Phase II approach to integrating technical data information systems requires an integrated conceptual data model to control and coordinate all the technical information systems supporting a weapon system. This concept of an integrated data model which will include a logical collection of shared data models to support all technical information system users is called the CALS Integrated Weapon System Database (IWSDB) which will provide the basis for the integrated shared data environment. The development of the Product Data Exchange Specification (PDES) will enable information systems to use a standard digital representation (data models) for product data. It will provide a complete, unambiguous, digital definition of physical and functional characteristics of each element/part of a weapon system throughout its life cycle.

To create, integrate, and manage the numerous data models of IWSDB or PDES requires support of a sophisticated standardized information resources management system. Data dictionaries which conform to relevant standards, such as IRDS, should be the mechanism used to acquire weapons system technical data in the CALS Phase II environment. These data dictionaries will be the data management and acquisition vehicle used to define, manage, and produce the required technical data for each weapon system. The initial development of the CALS data dictionary may occur in several major segments: PDD, LSA, and technical maintenance information. Also the initial data dictionaries should be built around the forthcoming release of MIL-STD-1388-2B with respect to defining the logistics related data.

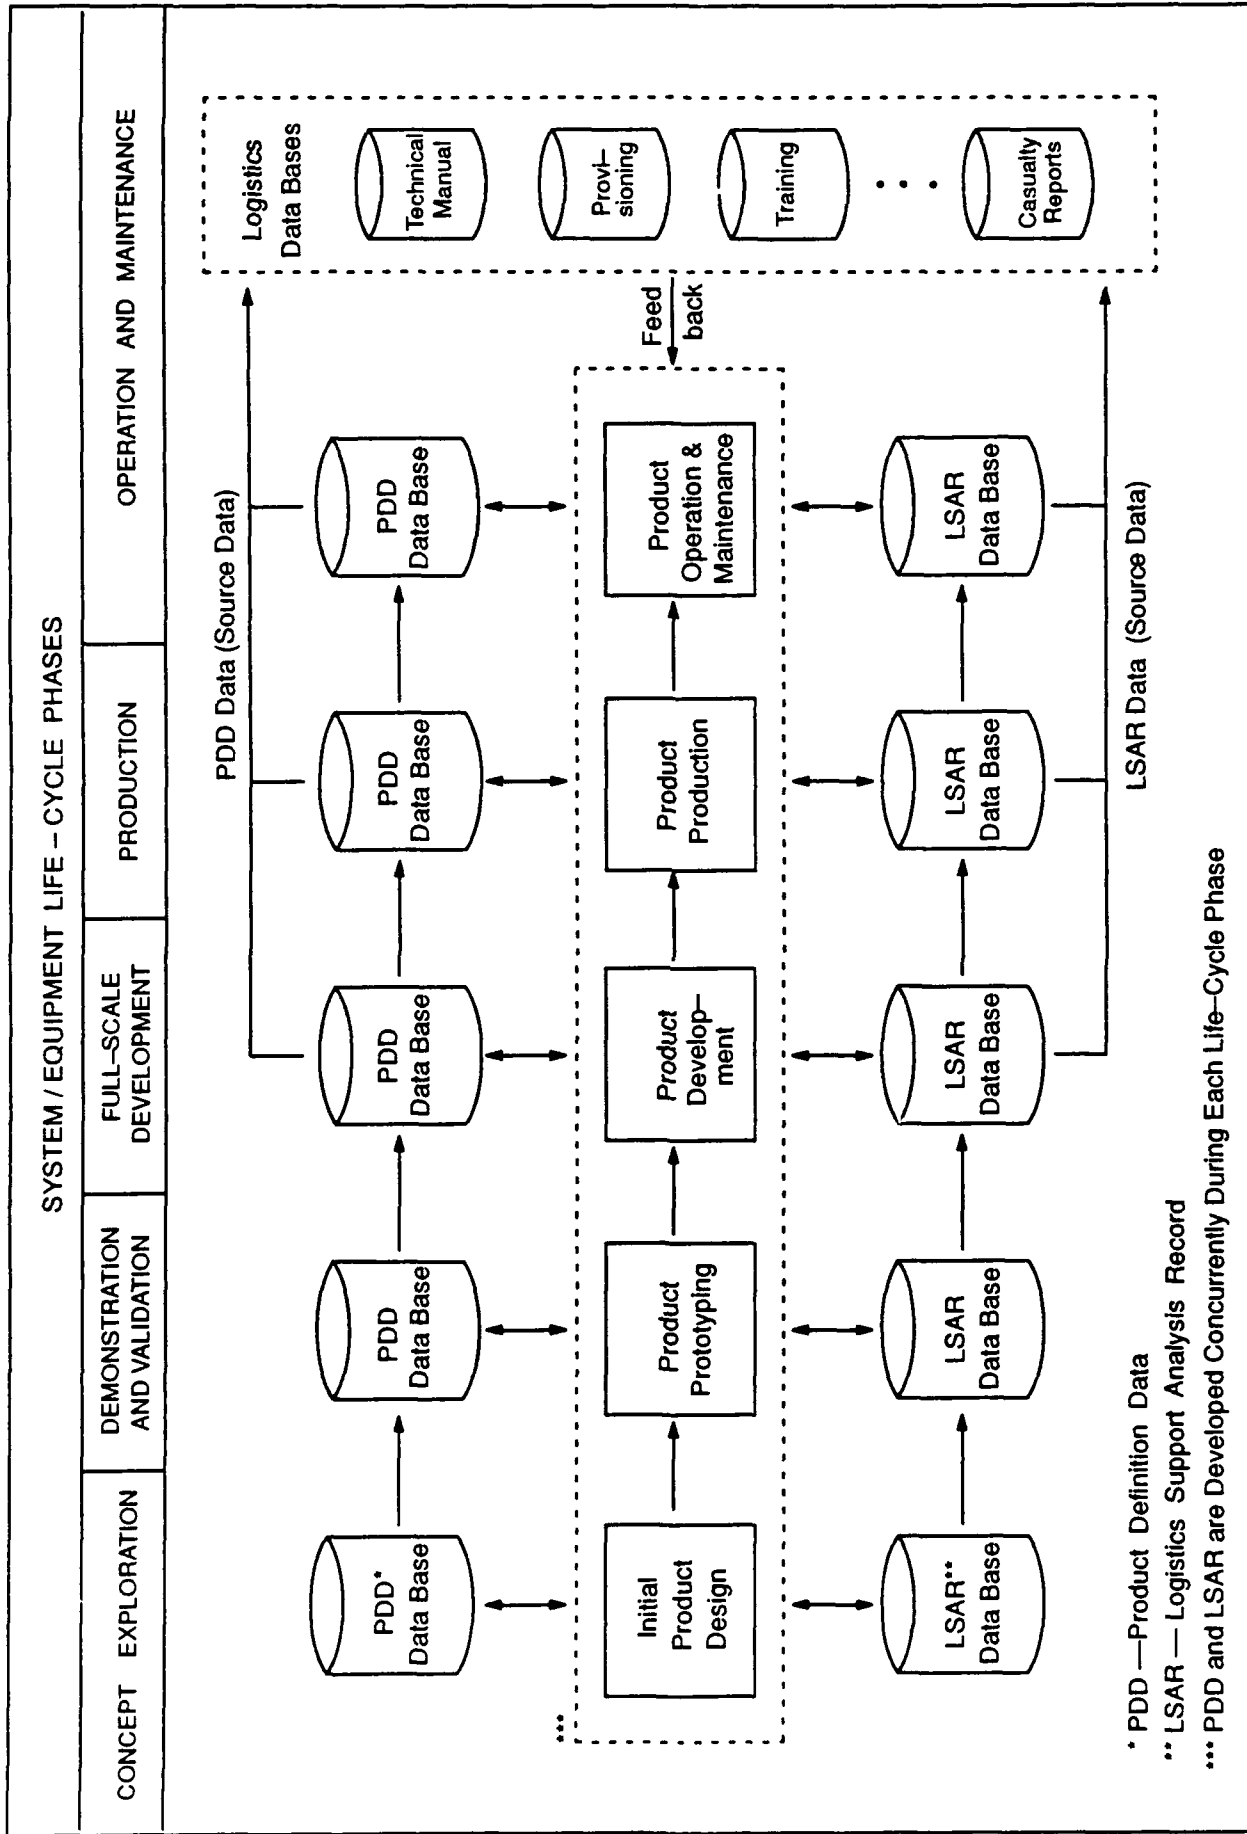

Fig. 2. Integration of the PDD, LSAR, and Logistics data bases.

4.1 Data Dictionary.

A data dictionary is a highly structured type of software system that can be used to model, integrate, and manage data in an organization's information resources. It contains information about the data items it stores; this information about data is called "metadata". Such data dictionaries are increasingly useful integration tools for supporting large information resource management systems such as CALS.

The IRDS is a set of software specifications for a standard dictionary system. An information resource dictionary (IRD) is an IRDS implementation. The IRDS standard was accepted by the American National Standards Institute (ANSI) in 1988 and was published as X3.138-1988. It was also adopted as Federal Information Processing Standard Publication (FIPS PUB) 156.

The purpose of the IRDS standard is to provide users of data dictionary systems with useful, flexible, and user-friendly software products to support all phases of the software system life cycle. The conformance of a data dictionary to the IRDS standard results in greater user efficiency and improved transportability of metadata between systems.

The IRDS is designed to support information modeling. The selection of the conceptual schema representation language in an information system is the crucial factor with regard to the integration of planning, design, software development, data administration, and users in the control architecture. The conceptual schema description of the IRDS standard is currently based on the Entity-Relationship-Attribute (ERA) (see Sections 2.2.i and 2.2.n) data model. The ability of IRDS to accommodate more robust flexible schema description languages such as NIAM must be included.

One of the most important features of the IRDS standard is called "schema extensibility", which means that when new requirements for information resources are defined, the IRD schema can be extended to meet those requirements. This feature also allows the movement of schema or metadata from one IRD to another. If an organization has two or more IRDs, each under the control of an IRDS conforming to the standard, the IRD-IRD transport allows entities and relationships along with their attributes to be transferred from one IRD to another.

Data dictionary systems have permitted the standardization of data elements used by multiple users and facilitated the documentation of such data elements. Data elements are the most basic data structures used in a data dictionary system. As the result of data element standardization, consistent data elements can be efficiently stored in data bases and can also be accessed by multiple users and programs. IRDS supports the standardization of data element names, definitions, and relationships, etc.

The ANSI X3H4 IRDS Standard Committee is completing two additional associated standards, the Export/Import File Format and the Service

Interface, for use in conjunction with the IRDS X3.138-1988 standard. The Export/Import File Format allows the IRDS to exchange data, while the Service Interface provides an interface with the CASE tools. The rectification of these two associated standards is expected to be completed in 1991. However, the current version of the IRDS standard (X3.138-1988) combined with the Export/Import File Format and the Service Interface will not be able to support the integration and life cycle management of the IWSDB/PDES data models developed using the various data modeling languages. The ANSI X3H4 Standard Committee is currently drafting a IRDS Reference Model (Section 2.2.d) which is intended to define the services, interfaces, and architecture of the next version of IRDS which is known as IRDS2. However, unless the X3H4 IRDS standard committee accelerates its development efforts, the completion of IRDS2 specifications is at least four to five years away. The question whether the IRDS2 will support the integration, life cycle management, etc. of IWSDB/PDES depends on the active participation and enthusiastic support of the CALS/PDES communities. The need for such participation and support can not be overemphasized.

Parallel to the data model integration being considered by the X3H4 IRDS committee, the PDES Dictionary/Methodology Committee is developing the PDES Unification Meta Model (PUMM) (Section 2.1.n) which attempts to unify the semantic and data abstraction of various modeling languages. The first three languages targeted by PUMM are Express, IDEF1X, and NIAM. The availability of PUMM for integrating PDES data models is not known at this time.

Recently, a task force from the CALS Industry Steering Group (ISG) was formed to develop plans for the CALS Directory/Data Dictionary Services. Its current charter is to define the scope, requirements, approach, and methodology required for obtaining directory/data dictionary services in a fully integrated CALS environment. Its interim report is expected in November 1990.

4.2 Conceptual Information Modeling.

The most critical aspects of any modern information systems methodology are: specifying the user's information requirements, validating these requirement specifications, and converting them into data base designs. Conceptual data modeling (see Sections 2.2.j, 2.2.l, and 2.2.m) has been used to fulfill these needs. Data modeling is becoming one of the most powerful techniques for establishing and maintaining control over information resources. Data models are used to represent conceptual schemas and to help integrate the information resources.

The input to the data modeling process is the information requirement specifications. The goal of data modeling is to obtain an integrated, formal implementation-independent specification (conceptual schema) of application-specific information. The data model resulting from such data modeling is implementation-independent in the sense that mapping is required to map the conceptual schema into a database management system.

A data model is a rigorous representation of the meaning of data elements and relationships among data elements within some scope of interest. A data model is sometimes referred to as a semantic data model and is typically represented by a graphical technique. If the same technique is used to produce the data models, then these data models considered as a whole can give an overall view of how their respective sets of data fit together. This neutral (conceptual schema) view of data can be mapped to the various physical database structures (internal schemas) as they are implemented and mapped to the user views (external schemas) as they are identified. Integrating large data resources without using data models can be difficult.

Many data modeling techniques are in use today. Data models can be represented in terms of diagrams or language statements. A number of different methodologies (NIAM, IDEF1X, Express, etc.) have been devised for conceptual data modeling. Such a methodology should be capable of supporting concepts such as "entity", "relationship", "cardinality of an entity", etc., as well as describing the requirement specifications captured.

The NIAM methodology (see Sections 2.2.m and 2.2.p) was chosen for CDM modeling because it offers a comprehensive set of features suitable for building data models. The semantic richness and expressive power of NIAM permit the end-user to be fully involved in the design of the information system. It draws the end-user into the data modeling process so that the end-user can verify the model to ensure that the final product will satisfy its requirements.

NIAM attempts to achieve a binary representation of the relationships between object classes. It is sometimes referred as a "binary semantic model". When any meaningful relationship involves more than two entity types, population tables are constructed to ensure the uniqueness and the correctness of the relationship and to avoid anomalies.

The NIAM model is a rich semantic network which emphasizes the meaning of information rather than its structure. NIAM's approach is stronger and more rigid than that of IDEF1X (see Sections 2.1.h, 2.2.1). In particular, mapping from IDEF1X to NIAM is not possible, but mapping from NIAM to IDEF1X is, since mapping from a stronger or equivalent model is always possible. As a result, the quality of the data model will be degraded when the data model schema is mapped from NIAM to IDEF1X.

One of the most interesting features of NIAM is the recognition and graphic portrayal of constraints on relationships. This provides documentation for all the semantics of the relationships between the objects in the scope being modeled. In addition, constraints that cannot be modeled as associative constraints are documented in text.

Perhaps the most useful feature of the NIAM model is its automated derivation of the fifth normal form of the NIAM model. This feature is made possible because NIAM considers the most elementary relationships

between the objects being considered and the constraints that they have to follow. Any further breakdown of the objects would lead to a loss of meaning and referencing ability. Since the objects being modeled represent the lowest level of data entity types, the normalizing algorithm leads to a normalized database schema in the fifth normal form. If a schema suggested by NIAM analysis is found to be not practical, the user has complete freedom to override the NIAM schema and reduce the high level of normality.

The IAST information modeling tool was used to produce the PDES reference models (see Sections 2.2.e, 2.2.f, and 2.2.g). In Canada IAST has been used since 1986 as the information modeling tool for the multimillion dollar effort of upgrading the Canadian Forces Supply System (see Section 2.2.b).

4.3 Logistic Analysis Support Record.

LSA is the implementation of DoDD 5000.39 (see Section 2.1.f). It is the process which combines those management and analysis actions necessary to ensure effective and economical support of a weapon system, both before and after its fielding. The basic management principle of the integrated logistic support process is that logistic support resources must be developed, acquired, tested, and deployed as an integral part of the weapon system acquisition process.

Two functional standards govern LSA and LSAR. The first, MIL-STD-1388-1, defines the LSA process in terms of providing a basis for LSAR. The second, MIL-STD-1388-2, defines those LSAR requirements pertaining to the assembling, managing, and reporting of data. Table 1 depicts the LSA tasks and LSAR records along with a possible strategy for selecting LSA tasks for the weapon system development phases.

The intent of MIL-STD-1388-1 is to ensure reliable, maintainable, and supportable weapon systems at minimum cost by integrating logistic support considerations into the evolving design effort. It is a dynamic, real-time interactive process requiring concurrence of the design, engineering analysis, and product support planning functions. As a result, addressing logistics requirements becomes part of the design process, rather than a consideration after design decisions that excluded support requirements have been made.

MIL-STD-1388-2 defines the format and content of the LSAR and the structure of various standard reports that deliver data in digital form. It consolidates logistics oriented technical information with data from the various engineering disciplines and integrated logistic support elements to reduce redundancy, facilitate timely usage, and promote consistency of data elements from the various disciplines.

DoD is revising MIL-STD-1388-2 and is implementing relational data base technology in the LSAR data system. The draft of revised MIL-STD-1388-2B provides new relational data base tables to replace the LSAR flat files used in MIL-STD-1388-2A. The use of relational

Table 1 – LSA tasks and LSAR tables.

| LSA Tasks MIL-STD-1388-2B | LSAR Tables MIL-STD-1388-2B | Possible LSA Strategy for Developmental Items | | | |

| 500 – Supportability Assessment 501 – Supportability Test, Evaluation, and Verification | | | X | X | X |

DBMS and tables offers many benefits, among which are ad hoc report generation and a more practical method of on-line access. Since the MIL-STD-1388-2B data base is already logically integrated, the use of other software tools as well as linkage with other related engineering data bases is encouraged. Other significant changes are the incorporation of new data elements, removal of the data entry instructions, and provision of expanded product reports.

The initial draft of MIL-STD-1388-2B was submitted to government and industry for review in May 1989. Review comments indicated that restructuring of the initial draft was needed. The comments were coordinated and implemented in the MIL-STD-1388-2B draft released in August 1990 for second review. The second draft MIL-STD-1388-2B is a vast improvement over the initial draft. However, it is not known when this standard will be released for publication.

4.4 The Content Data Model.

Since weapon systems are becoming more complicated and sophisticated, the weapon system maintenance concept of the 1990's includes numerous diagnostic capabilities, technical and historical information systems, computerized test equipment, and computer aided training. If all these automated support capabilities continue to develop independently, the technicians using them will be required to use several different data systems to access needed information. This problem is also compounded by the massive amount of cumbersome paper-based technical manuals.

To alleviate these problems, AFHRL is developing the Integrated Maintenance Information System (IMIS) to provide technicians with immediate access to all the information needed to efficiently and effectively perform aircraft maintenance. The objective of IMIS is to provide technicians with a rugged, portable computer display system that will interface with other computer systems to provide an integrated database of all the information needed for aircraft maintenance.

When AFHRL considered the requirements for the IMIS, the need for an "integrated, revisable and neutral" database of maintenance information to replace the existing paper-based TM system became apparent. AFHRL proposes CDM (see Sections 2.1.g and 2.1.j) as a data base specification to meet the future needs of weapon system maintenance support and as a standard for interchanging integrated technical maintenance information.

The CDM defines all interrelated maintenance information in terms of content. It is an attempt to consider all such maintenance data as a unified whole, while working toward the goal of integrated maintenance information. The CDM is an integrated database of neutral data in that it does not have embedded information in it that describes how the data is to be used. The main advantage of a neutral data representation is that the information can be used in many different ways by many different application programs. A normalized relational database is a means of representing such neutral data. To ensure that databases of maintenance information created in 1990 remain capable of meeting future needs,

the data representation must be flexible enough to support new uses of the information.

CDM represents technical manual content as a set of discrete "data elements" that are associated via structural "links" that connect related data elements for electronic "hypertext" presentation. For this type of document, separate data elements are linked into a network structure based upon semantic relationships between data elements. For instance, a series of data elements describing the individual steps of a repair procedure might be linked together in this way, with additional linkages from each step to a corresponding illustration, warning, caution, etc. With the help of special presentation software, the user is able to request and access directly the specific information (data elements) needed at a given time.

Each CDM data element has content and attributes as well as relationships to other elements. The classification of the data elements within the CDM can also be expressed using a variety of modeling languages. The CDM is basically a hierarchical structure corresponding to the functional organization of the weapon system. Vehicle information is composed of system information, which in turn is composed of subsystem information, which in turn contains parts and troubleshooting information, as well as a collection of functions which describe maintenance tasks in terms of the steps required to complete them.

The CDM also contains narrative information, warnings and cautions, cross-references, and configuration management attributes. The individual elements within the CDM can be represented in many ways: text, graphics, tables, video frames, audio, etc. Each data element within the CDM is uniquely identified and therefore can be retrieved and manipulated individually. Shared data elements are stored only once. Each data element within the hierarchy can have attributes that identify content type, security, validation status, etc.

The CDM maintains compatibility with MIL-STD-28001 (see Section 2.1.d) by using the SGML (see Section 2.2.h) methodology as the specification language for describing the structure of documents. The resulting CDM specification is realized in an SGML Document Type Definition (DTD). Although the CDM employs SGML, the physical storage of the database it defines should vary from application to application. SGML has a flexible, parsable, and hierarchical syntax. SGML makes a clear distinction between data elements and the formatted representations of those elements.

The CDM is a generic way to structure an assemblage of maintenance information from many different types of documents in such a way that the links are retained and redundancy is held to a minimum. The CDM specifies a data structure which is useful for transferring information from one agency to another, such as, for example, data transferred from a prime contractor to the Government to fulfill a contract data requirement. Under this concept, the contractor prepares and uses a document instance (DI) as a deliverable for a contract. The contract must previously

specify the SGML Declaration and the DTD to be used for the DI. During the preparation of the DI, the contractor is free to use whatever internal authoring tools he feels are productive. Just prior to shipping, the DI is checked against the contractor's copy of SGML Declaration and the DTD.

Figure 3 depicts a life-cycle phase scenario for generating and updating a CDM instance. Figure 3 also shows the relationship between the contractor's source data (CDM and LSAR data), the CDM data (a view of the contractor's source data), and the technical manual instances (views of the CDM data). The PDD (Box I of Figure 3) contains design, engineering, and manufacturing information which can be in the form of text or graphics files. The PDD provides the CDM with all the graphics required for illustrations and diagrams. The format of these graphics can be CGM, IGES, etc. These digital graphics files have been generated and stored in the PDD database, and they can be invoked by the CDM as external files.

The LSAR (Box II) contains all the maintenance support information required by the CDM instance. A CDM instance (Box III) can be generated from the LSAR and PDD databases. This CDM instance contains all the maintenance support information for either a piece of equipment, or one or more weapon systems in the form of text marked up with SGML tags. The CDM.DTD shown above the arrow head line connecting Boxes II and III can be regarded as a template or a filter with respect to this SGML marked up text loaded to the CDM from the LSAR. It should be noted that the arrow head lines of Figure 3 can be considered as processes which process and transfer data contained in one box to another box as indicated.

After the CDM instance (Box III) is generated, instances (SGML markups) of different types of technical manuals or view packages can be generated from the CDM instance by "filtering" it with respect to the DTDs for these types of technical manuals. For example, the CDM contains maintenance support information concerning the Job Guide, Fault Isolation, and Depot Level procedures, etc. If the Job Guide DTD (JG.DTD) shown above the line connecting Boxes III and IV is applied to the CDM, then the Job Guide instance generated (Box IV) is in conformity with the JG.DTD; that is, the Job Guide instance will parse against the JG.DTD. This Job Guide instance will contain required information for the organizational level maintenance of a piece of equipment or a system. Similarly the instance in Box V is geared toward the Fault Isolation DTD (FI.DTD).

The technical manual instances in Boxes IV or V consist of SGML marked up text which does not contain formatting information. As a result, such instances are difficult for people to read. More importantly, these instances can not be processed for output with respect to a medium (paper hard copy, screen display, etc.) unless appropriate formatting information is combined with these instances. Such formatting information is provided by a Formatted Output Specification Instance (FOSI) defined below.

An Output Specification (OS) is an SGML construct which details the formatting options available for the output of technical manual instances

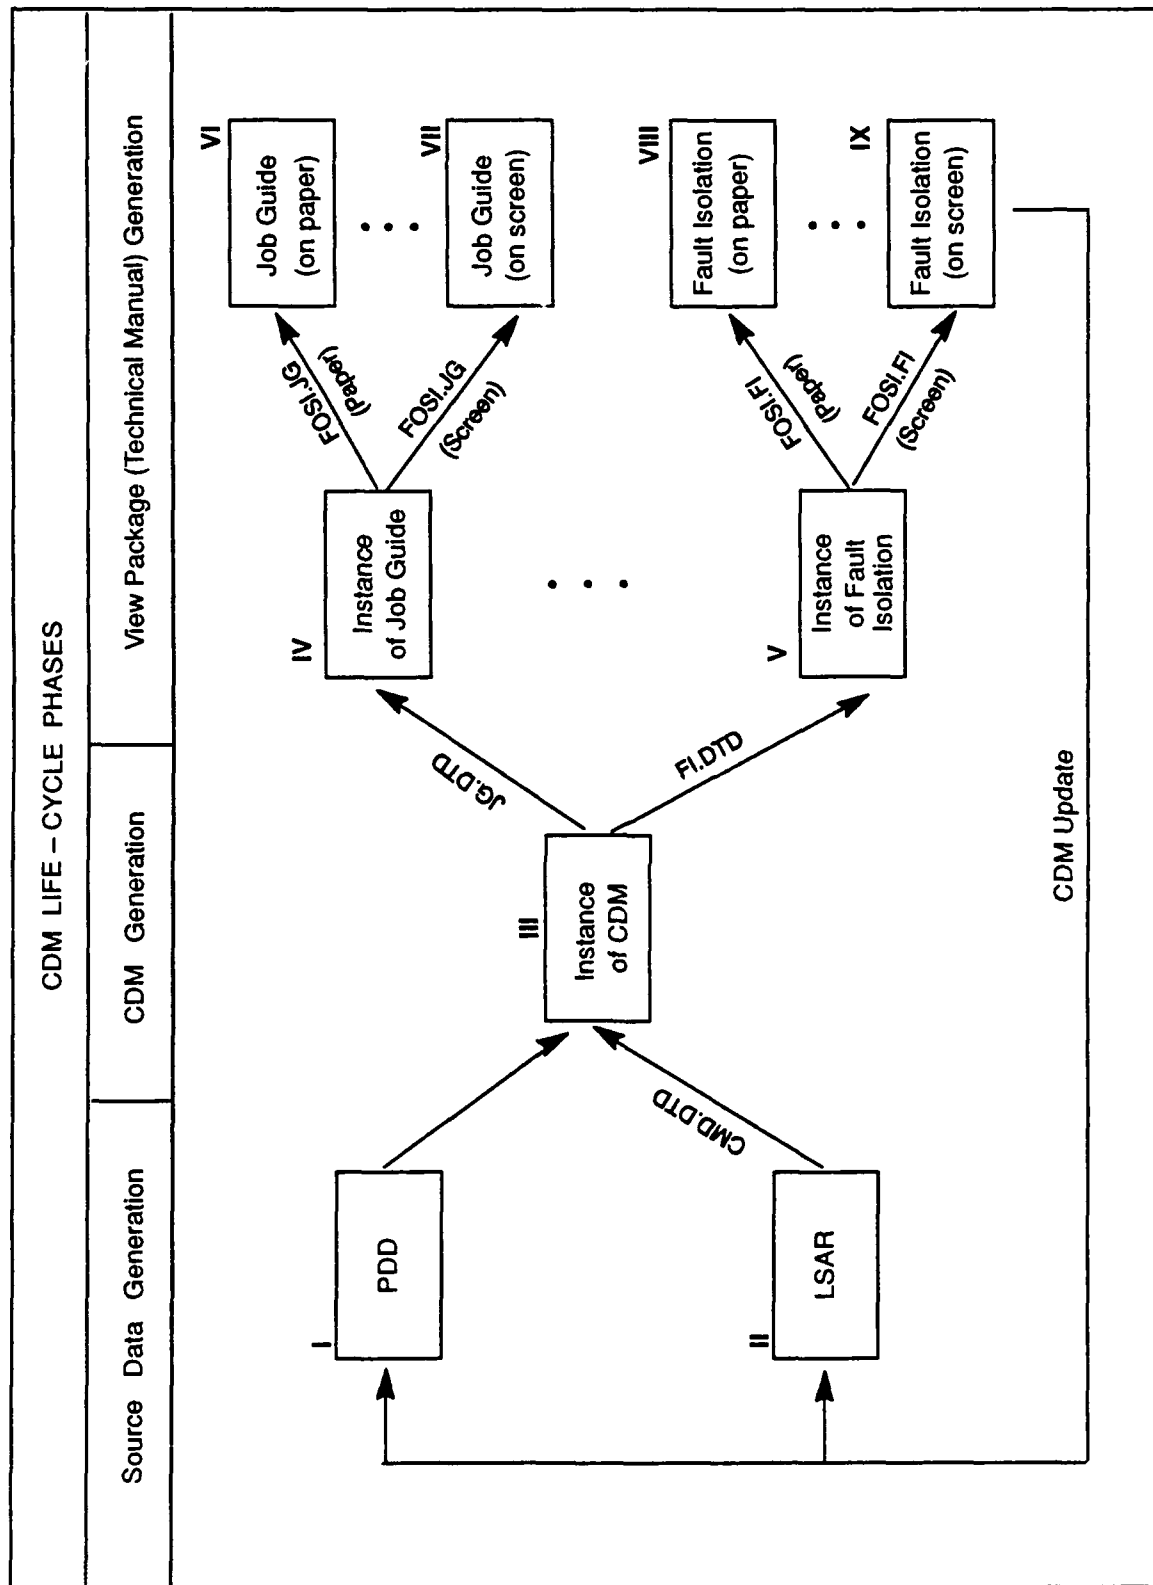

Fig. 3. CDM generation and updating.

conforming to DTDs such as the Job Guide (JG.DTD) and Fault Isolation (FI.DTD), etc. The current version of the OS is geared specifically toward paper documents. In the future, either the OS will be extended to other display media or an OS will be developed for each display medium.

A Formatted Output Specification Instance (FOSI) is an SGML construct which specifies those values chosen for the formatting options from the available values in the OS, and which binds those choices to elements and their attributes of a particular DTD with respect to formatting. The OS must fully support all the characteristics of an output medium while the FOSI merely specifies the chosen values for the relevant options with respect to a given formatting application.

After the FOSIs for the Job Guide technical manual have been obtained from their respective OSs, the Job Guide instance is combined with the FOSI for the chosen medium for output processing. In particular, Box VI contains the paper hard copy of the Job Guide technical manual generated from the combined processing of the Job Guide instance (Box IV) and Job Guide FOSI for paper output. Likewise, Box VII contains the screen display of the Job Guide technical manual generated from the combined processing of the Job Guide instance and the Job Guide FOSI for screen display.

With respect to the Job Guide instance (Box IV), it should be noted that the FOSI for paper hard copy output (Box VI) will be different from the FOSI for screen display output (Box VII). Moreover the FOSI for paper hard copy output (Box VI) will also be different from the FOSI for the paper hard copy output (Box VIII) for the Fault Isolation instance (Box V).

Any changes or updates to the CDM instance (Box III) due to the correction of errors found in the technical manuals or the imposition of new requirements will have to be implemented at the source data level in the PDD (Box I) and the LSAR (Box II).

The CDM instance (Box 3) can be used to instantly generate a CDM view package which includes all necessary maintenance information for a particular maintenance job, and which can be loaded to a portable storage and display device for the use of a maintenance technician.

5 Data Dictionary of Content Data Model. (Also see Appendix F)

The CDM/NIAM data dictionary (Section 60) was developed using PC-IAST (see Section 2.2.a) which is an NIAM implementation. PC-IAST is a CASE tool developed by the Control Data Corporation. Boxes II, III and IV of Figure 1 show the development process for the CDM/NIAM data dictionary. Boxes VIII, IX, X, and XI of Figure 1 represent the various data models and outputs which can be generated from the CDM/NIAM data dictionary.

5.1 CDM Specification. (Also See Appendix D)

Section 40 contains the CDM specification (developed by AFHRL) defining revisable, format-free technical information for weapon system maintenance. These CDM specifications take the form of an SGML DTD which describes the logical structure of a technical information database. These specifications are not intended to describe a database definition. Rather their purpose is to describe the data elements that will make up any acceptable database design.

5.2 CDM/NIAM Conceptual Schema. (Also see Appendix E)

The CDM specification (Section 40) are used as the input requirement for the development of the CDM/NIAM conceptual schema (Section 50.2).

The PC-IAST software tool is employed to graphically identify the objects, relationships of objects, and constraints between objects of the CDM for consistency to ensure that the CDM/NIAM model developed is complete and internally consistent. The CDM/NIAM model is a rich semantic network that concentrates on the meaning of information rather than its structure. For the detailed steps for generating the CDM/NIAM conceptual schema, see the instructions in Section 2.2.a.

PC-IAST provides the ability to create and maintain many distinct data dictionaries or data models. One model may have one or more "scopes" which can be considered as a "user view". PC-IAST may be applied to a model or to a scope of a model. Scope-based operations are useful for obtaining reports and diagrams of a portion of a model for review as well as specifications of a distributed portion of the information base. The CDM/NIAM conceptual schema developed are presented twenty scopes or submodels as shown in Section 50.2.

PC-IAST is capable of producing a graphical plot of a model on a printer or a plotter. The graphics file generated by the GRAFTOOL capability of PC-IAST uses the exchange format "DXF". This graphics file can be used as input to a computer-aided design (CAD) system capable of accepting DXF format files, such as AutoCAD. The CAD system is used to obtain a hard copy of the conceptual schema of a model or a scope of a model. The schema displayed on the screen of the CAD system can also be manipulated and modified. Section 50.2 contains the graphic plots generated by AutoCAD using the CDM/NIAM conceptual schema.

PC-IAST supports the exchange of models between other installations of PC-IAST. The transfer files containing the data dictionary stored on a floppy disk can also be used for archiving or backup purposes.

5.3 CDM/NIAM Data Dictionary. (Also see Appendix F)

Each time a new conceptual schema is generated, it is necessary to create a data dictionary database which is used to design, locate, protect, manage, and control data items with respect to:

- category of data element
- definition of data element
- relationship of the data element to other data items
- format of the data element.

After the completion and validation of the CDM/NIAM conceptual schema (Section 50.2), the generation of the CAM/NIAM data dictionary is complete. This CDM/NIAM data dictionary can be used to generate other data models and data schema which are described in the following four sections.

5.4 CDM Neutral Data Model. (Also see Appendix G)

The Neutral Data Model is a normal form record model generated from the conceptual semantic schema which provides an overview of the data record structure. This Neutral Data Model represents the optimal design of the data structure because it eliminates update anomalies and enables the database to support any valid functional use of data. The schema thus generated can be regarded as a neutral data model that can be introduced into a appropriate relational DBMS. The neutral aspect of the record model means that it is independent of any database structure or product.

PC-IAST offers two grouping modes: "strong" and "weak". The strong model is a fully normalized grouping that preserves the model as defined. No reference class suppression or null valued fields are allowed. The weak grouping makes provision for adjusting the grouping rules to produce a simpler data model by suppressing reference classes and permitting null valued fields.

The topographical print (see Section 70.1) produces the record structures in diagrammatical form, indicating the relative subset hierarchical relationships between the records. Structures which have no subset relationships appear first, followed by records which are subsets of the records displayed initially. The neutral data model diagram contains the structures with all the fields in each structure, as well as the uniqueness constraints that apply to the fields.

A cross-reference list (see Section 70.2) indicates the path number with its "to" and "from" origins. Above each record, the unique identifiers are indicated with the standard double-arrowed lines.

The superset is indicated in the record with the "^" character appearing in the bottom part of the record. A path number under this character "tiers" the superset to its corresponding subset. The subset is indicated by the "<" character appearing in the top part of the record. Its path number appears above this character.

5.5 CDM/ORACLE-SQL Database Schema. (Also see Appendix H)

Once the neutral data model has been generated and reviewed, the next step is to transform the data model into a data definition language for a DBMS. The PC-IAST software supports several different DBMS products. In fact, there are eight "pipes": SQL (ISO SQL86), Oracle, IM/DM,

IM/PERSONAL, INFOCEN, INGRESS, INFORMIX, and ASN.1 (OSI Abstract Syntax Generation) supported by PC-IAST.

Section 80.1 shows an example that an ORACLE database schema has generated. The system produces a report of the constraints (see Section 80.2) which could not be taken into account due to the capabilities currently available in the ORACLE database manager.

5.6 CDM/Express Data Model. (Also see Appendix I)

The CDM/Express data schema (Section 90) is automatically generated by the PC-IAST from the CDM/NIAM data dictionary.

5.7 CDM/IDEF1X Data Model.

PC-IAST can be used to transform the NIAM conceptual schema into data model documentation consistent with the IDEF1X version of the ER modeling technique. PC-IAST will automatically produce documentation and diagrams from an IDEF1X data model generated from the NIAM model and its associated CDM neutral data model.

PC-IAST can generate IDEF1X diagrams with three levels of detail: entity-only, key-only, and full-attribute. The graphic diagrams generated are formatted in DXF which can be plotted on an AutoCAD system.

Since the generation of the CDM/IDEF1X data model is not funded for this project, the PC-IAST tool option for converting NIAM to IDEF1X has not been exercised.

6 Integration of CDM and MIL-STD-1388-2B.

A sophisticated data dictionary system should provide the five levels of services outlined and described in Section 2.1.1. These five levels of service are listed in the first column of Table 2 below. For the purpose of comparison, references to the relevant dictionary data of CDM and MIL-STD-1388-2B are provided in the second and third columns, respectively.

It should be noted that at present the relevant standards as well as the software CASE tools do not support the integration of these two data dictionaries: CDM (using NIAM as data modeling method) and MIL-STD-1388-2B (using IDEF1X as data modeling method). Accordingly, this section first compares the data elements of CDM/NIAM and MIL-STD-1388-2B to assess the compatibility of these two data dictionaries, and then it proposes strategies for integrating a maintenance task related subset of a MIL-STD-1388-2B data dictionary into a CDM data dictionary to form a new data dictionary hereafter called the CDM-LSAR data dictionary.

Table 2 – Levels of Data Dictionary services.

| Level of Service | | CDM | MIL-STD-1388-2B |
|------------------|-------------------------------|------------|-----------------|
| 1 | Define Data Element | Appendix F | Appendix E |
| 2 | Define Simple Structure | Appendix F | Appendix A |
| 3 | Define Business Rules | Appendix F | |
| 4 | Support Multiple Views | Appendix E | |
| 5 | Support Life Cycle Management | | |

6.1 Data Element Level.

When the proposal for this project was developed in the fall of 1989, the MIL-STD-1388-2B was expected to be published in the Spring of 1990, but the publication of this standard was delayed. In August 1990, the second draft of MIL-STD-1388-2B (dated 6 June 1990) was received. This draft version of MIL-STD-1388-2B was used for this report.

The CDM/NIAM data elements contained in Appendix F of this report and the data elements contained in Appendixes A and E of MIL-STD-1388-2B were compared and assessed.

6.1.1 Cross reference of CDM and MIL-STD-1388-2B Data Elements. (See Appendix J)

Section 100 contains matched data elements of CDM and MIL-STD-1388-2B. The rows of Section 100 contain those CDM data elements which can be derived from data elements of MIL-STD-1388-2B. The data definition and data format of the matched data elements may not agree exactly.

6.1.2 MIL-STD-1388-2B Data Elements Available for CDM Use. (See Appendix K)

Section 110 contains those data elements of MIL-STD-1388-2B which can be used as source data and also added to CDM.

6.1.3 CDM Data Elements Not Available From MIL-STD-1388-2B. (See Appendix L)

Section 120 contains a list of CDM data elements for which the source data is not available from MIL-STD-1388-2B.

6.2 Data Schema Level.

The maintenance task support function contained in MIL-STD-1388-2 was originally intended to provide a summary of maintenance task requirements such as those provided in LSAR reports 023 and 024.

The current practice in TM development is to first develop the related LSAR data records and reports and then use them as source or reference data for use in authoring a TM as depicted in Figure 4.

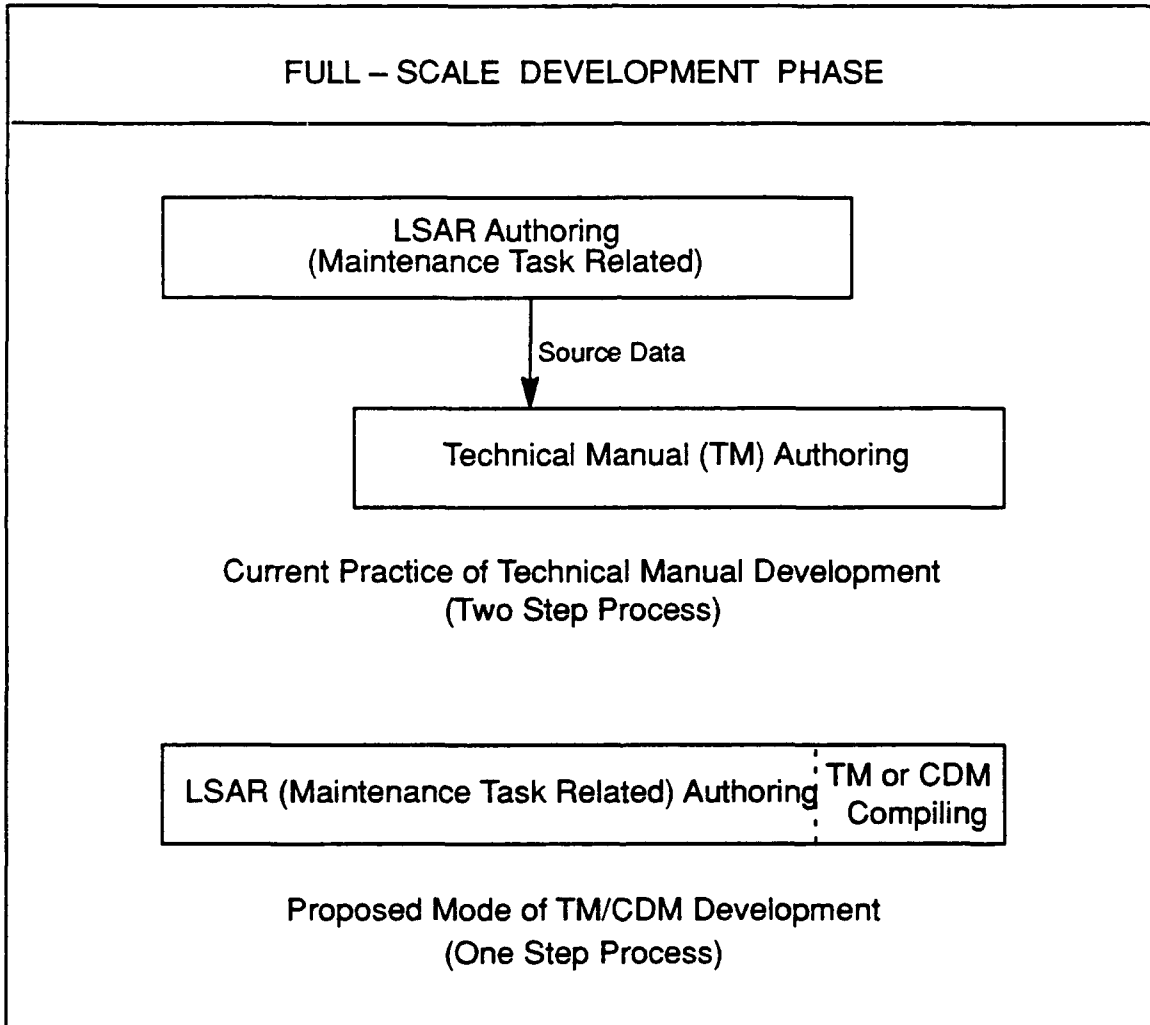

Fig. 4. Modes of technical manual development.

An alternative procedure in TM development is to combine this two step process into a one step process as shown in the lower portion of Figure 4. This combined one step process requires the integration of the LSAR and

CDM databases. In this one step process, all the data needed for the TM development is obtained at the LSAR stage. This one step process can considerably diminish the TM (or CDM) development time and cost for both Government and contractor. In the one step approach, the Government needs to define the TM requirements and go through validation and acceptance procedures for the TM product only once. Likewise industry needs to develop and deliver the TM product only once.

6.2.1 IRDS Standard Approach.

It is proposed that the CDM data dictionary and a maintenance task related subset of the MIL-STD-1388-2B data dictionary be combined to form the new CDM-LSAR data dictionary. IRDS CASE tools will be used for the development work. Figure 5 depicts the generation of this new data dictionary. The integrated CDM-LSAR data dictionary using ERA data modeling language is created in the following way:

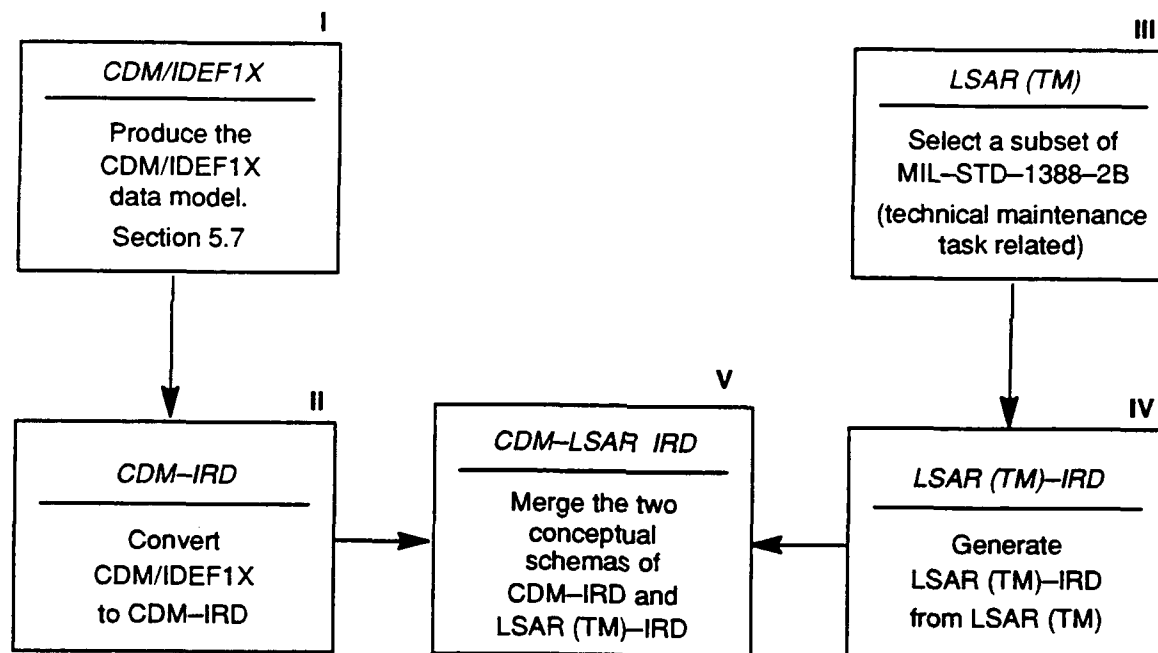

Fig. 5. IRDS approach of the integration of the CDM Data Dictionary and a subset of the MIL-STD-1388-2B Data Dictionary.

a. Use the PC-IAST CASE tool to convert the CDM/NIAM data model of Section 5.7 to a CDM/IDEF1X data model (Box I of Figure 5).

b. Use the IRDS CASE tool to generate CDM-IRD (ERA data model) from the CDM/IDEF1X data model (Box II of Figure 5). Although the IRDS standard

uses the ERA modeling technique, there are no significant differences between the ERA and IDEF1X modeling techniques.

c. Select a technical maintenance task supporting subset from Appendix A of MIL-STD-1388-2B and call it "LSAR(TM)" (Box III of Figure 5).

d. Generate the LSAR(TM)-IRD (ERA data model) with the IRDS CASE tool (Box IV of Figure 5).

e. In Box V, use the IRDS CASE tool to compare the similarities and differences in the definition, structure and format of the data element across the CDM-IRD and LSAR(TM)-IRD data models needed for integration.

6.2.2 NIAM Approach.

The PC-IAST CASE tools can also be used to integrate the CDM and MIL-STD-1388-2B data dictionaries. The procedures would be similar to the one in Section 6.2.1. NIAM would be used instead of the ERA modeling methodology. The CASE tool PC-IAST provides the capabilities required to merge (see Figure 6) the NIAM data models.

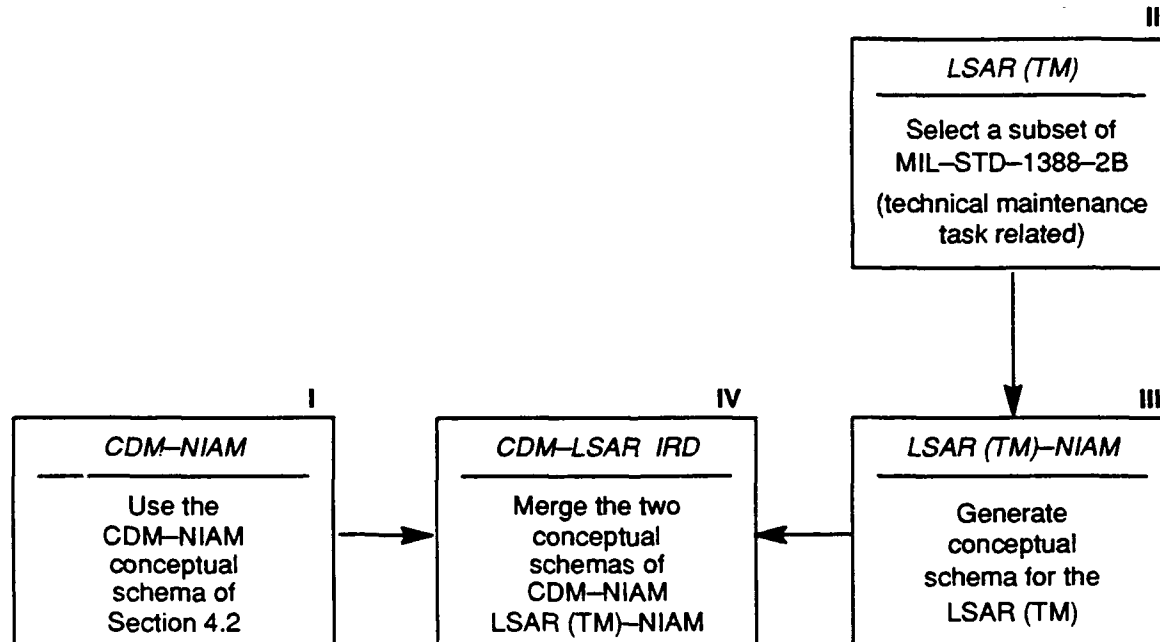

Fig. 6. NIAM approach of the integration of the CDM Data Dictionary and a subset of the MIL-STD-1388-2B Data Dictionary.

The integrated CDM-LSAR data dictionary with NIAM is created in the following way.

- a. Use the conceptual schema of CDM-NIAM created as indicated in Section 4.3. (Box I of Figure 6).
- b. Select a technical maintenance task supporting subset from Appendix A of MIL-STD-1388-2B and call it "LSAR(TM)" (Box II of Figure 6).
- c. Generate the LSAR(TM)-NIAM with the PC-IAST CASE tool (Box III of Figure 6).
- d. Merge these two conceptual schema of CDM-NIAM and LSAR(TM)-NIAM to form a new conceptual schema of CDM-LSAR (Box IV of Figure 6).

6.3 Benefits of the Integration.

The following benefits would be obtained from this prototype integration of CDM and a maintenance task supporting subset of MIL-STD-1388-2B:

- a. The integrated CDM-LSAR data dictionary can be used as the TM authoring database.
- b. The results obtained from the analysis and integration of CDM and MIL-STD-1388-2B will provide valuable feedback for their further integration efforts.
- c. The experience gained in integrating these two CALS data models will be valuable in the design and planning of the future integration of the IWSDB/PDES data models on a larger scale.
- d. The lessons learned in using the IRDS CASE tool in the CALS environment are of great value in the development of the IRDS standard.

7 Recommendations.

Work on this project began in January 1990. When the project had reached the point of writing the final report in August 1990, AFHRL upgraded the CDM specification to Version 5.3. At the same time, the second government and industry review of MIL-STD-1388-2B was under way. Clearly, this project is just the beginning, not the end, of attempts to integrate CDM and MIL-STD-1388-2B.

Since the CDM specification and the MIL-STD-1388-2B standard were developed independently, they are not compatible with each other at the present time. Moreover, because the potential benefit from integrating these two CALS databases is considerable, the following work is recommended for continuation.

- a. Update the CDM Specification.

Since AFHRL upgraded the CDM specification to version 5.3 in August 1990, update the CDM/NIAM data dictionary of Section 5 of this report with the new version of CDM. Also verify the CDM/NIAM conceptual schemas

using the "population table" facility provided by the latest version (August 1990) of PC-IAST. Finally develop the CDM/IDEF1X data model as indicated in Section 5.7.

b. Enhance the compatibility of CDM and MIL-STD-1388-2B at the data element level.

Appendixes J, K, and L of this report should be used as a reference to enhance the CDM specification and the MIL-STD-1388-2B to make them more compatible with each other at the data element level. (see Section 6.1)

c. Develop a prototype of the integration of CDM and a subset of MIL-STD-1388-2B with IRDS standard.

Employ IRDS CASE tools (such as the IRMS developed by InfoSpan) to integrate CDM and a subset of a MIL-STD-1388-2B (technical maintenance task related) data dictionary. For details, see Section 6.2.1.

d. Develop a prototype of the integration of CDM and a subset of MIL-STD-1388 -2B with PC-IAST CASE tool.

As an alternative to the IRDS standard, a PC-IAST CASE tool is available to integrate CDM and a subset of a MIL-STD-1388-2B (technical maintenance task related) data dictionary. For details, see Section 6.2.2.

e. Whenever PUMM (see Section 2.1.n) becomes available for use, prototype the integration of CDM and MIL-STD-1388-2B with PUMM.

f. Actively participate in and support the IRDS standard development by the CALS/PDES communities.

Acknowledgements

Barely a year has passed since the preparation of the proposal for this project. Since then funding for the work was obtained, the work was performed, and this report was prepared. The completion of this project in such a short time was possible only with the help of many people.

The author first wishes to thank his division head William Camara and his branch head Joseph Garner for their technical guidance and assistance. Special appreciation is extended to his colleague Donald Gignac who participated in many hours of technical discussion and who edited this report. In particular his assistance in the preparation of Figure 3 is gratefully acknowledged. The author also thanks his colleague Mary McCarthy for illuminating technical discussions.

The author wishes to acknowledge the assistance of the following DTRC personnel: Robert Schaffran and Jack Brainin for funding the initial study and proposal writing; Joseph Fuller for expediting the transfer of project funds from the Air Force to DTRC; and Patricia Blake for typing this report; Carol Naas for preparing the figures and tables for publication; and Alice Phillips for reviewing the final draft.

The Author wishes to thank the following AFHRL personnel: David Gunning for both funding this project, and providing his technical assistance when required; and Lt. Brian Caporlette for his technical assistance.

Finally, the author wishes to extend his thanks to the following people in private industry: Pam Gennusa and James Oldfield of Datalogics for their review and comments on the draft of Figure 3; Paul Thompson of Control Data Corporation (CDC) and John Zimmerman of Allied Signal for their review and comments on the draft of Appendix C; Joan Milloy of CDC for her assistance in compiling Appendix E; and Ron Shroder and Walter Werts of RJO for their technical assistance.

Appendix B - Definition of Terms.

20 Definition of Terms.

Attribute - A characteristic or descriptor name of an entity.

Cardinality - The number of instances of one entity that can be related to an instance of another entity.

Computer-aided Acquisition and Logistics Support (CALS) - A joint DoD and industry initiative to facilitate the integration of digital technical information for weapon system acquisition, design, manufacture, and support functions. For details, see Sections 2.1.c and 2.1.e.

Concurrent Engineering - A systematic approach to creating a product design that considers all elements of a product's life-cycle from conception through disposal. For details, see Section 2.2.o.

Content Data Model (CDM) - A specification that defines a revisable, format-free database of integrated technical information. For details, see Sections 2.1.g and 2.1.j.

Data Dictionary - A type of database, containing metadata used to design, monitor, document, and control data in information resource systems. For details, see Sections 2.1.k and 2.1.m.

Data Model - A data model is a rigorous representation of of data elements and the relationships among them with respect to some unifying factor or factors. For details, see Section 2.2.k.

Document Instance (DI) - Text marked up with SGML tags with respect to a particular DTD. For details, see Section 2.1.d.

Document Type Definition (DTD) - An SGML construct which completely defines and unambiguously describes the structure of a class of documents. For details, see Section 2.1.d.

Entity - Refers to either of the following:

- o Entity Instance - A specific object, either real or abstract, used to store data.
- o Entity type - A collection of entities that have similar properties.

Entity-Relationship-Attribute (ERA) Model - An extended version of Entity-Relationship (ER) Model (see Section 2.2.i). It is a methodology or technique for data modeling. For details, see Section 2.2.n.

Express - A PDES language used to model information. For details, see Section 2.2.c.

Formatted Output Specification Instance (FOSI) - An SGML construct

which specifies the formatting options for the document instance with respect to an Output Specification. For details, see Section 2.1.d.

Information Analysis Support Tool (IAST) - A CASE tool for information modeling based on NIAM. For details, see Sections 2.2.a.

Integrated Computer-Aided Manufacturing Definition (IDEF1X) - A methodology used to produce a data model which represents the data structure and semantics of an information system. For details, see Sections 2.1.h and 2.2.1.

Information Resource Dictionary (IRD) - A data dictionary application managed by an IRDS.

Information Resource Dictionary System (IRDS) - A set of standards and specifications resulting from both Federal and international efforts for data dictionary systems. For details, see Sections 2.1.k. and 2.1.m.

Logistic Support Analysis (LSA) - Analysis concerning the scope and level of logistic support. For details, see Section 2.1.a.

Logistic Support Analysis record (LSAR) - A document that provides detailed data generated by an LSA process concerning logistic support requirements. For details, see Section 2.1.b.

Integrated Weapon System Data Base (IWSDB) - Both the conceptual definition of and the total logical collection itself of shared product definition data and logistic support data for a specific weapon system. For details, see Section 2.1.e.

Metadata - Data that describes other data.

Nijssen Information Analysis Method (NIAM) - An information modeling methodology based on the binary relationship technique. For details, see Sections 2.2.m and 2.2.p.

Normalization - A process of obtaining "stable" groupings of attributes and relations.

Output Specification (OS) - An SGML construct that describes the formatting and style options for a class of documents whose structure is defined by a particular Document Type Definition (DTD). For details, see Section 2.1.d.

Product definition Data (PDD) - The data that comprises the information needed for the design, analysis, manufacture, testing, and inspection of a product. For details, see Section 2.1.e.

Product Data Exchange Standard (PDES) - A voluntary standardization effort to provide a complete, unambiguous, digital data definition of the physical and functional characteristics of each element/part of a product throughout its life cycle.

Schema - A diagram describing the semantic or relational structure of data.

Standard Generalized Markup language (SGML) - A methodology used to define the structure of documents in terms of an abstract and unambiguous notation, independent of application and input/output devices. Five relevant SGML concepts are: the SGML declaration, the Document Type Definition (DTD), the Document Instance (DI), the Output Specification (OS), and Formatted Output Specification Instance (FOSI). For details, see Section 2.2.h.

SQL - The standard data definition and data manipulation language for a relational database.

Appendix C - NIAM Modeling Guide.

30 NIAM Modeling Guide.

NIAM or binary semantic modeling attempts to achieve a binary representation of the relationships between object classes. NIAM emphasizes presentation the meaning of information rather than its structure. When any meaningful relationship involves more than two object classes, population tables are constructed to ensure the uniqueness and the correctness of the relationship.

NIAM conceptual schema diagrams can be represented graphically by objects, roles of objects, and constraints on roles and objects. The following is a definition of the symbols which are used in the NIAM binary relationship modeling of Appendix E and which were primarily derived from Sections 2.2.m and 2.2.a.

30.1 Objects - Objects are real or abstract entities. Two classes of objects are used in NIAM, they are entity types and label types.

Entity Type - A collection of objects that have similar properties. An entity type is represented graphically as a solid circle and referenced by "label type" in database.

Example: "Employee" is the set of all people who are hired.

Label Type - A label type is used to reference a particular entity type. A label type is represented graphically as broken circle. Label types are lexical objects in database tables that are used to refer to entity types. Example: "surname"

30.2 Roles - Roles indicate relationships between objects.

The roles played by entity types are explicitly shown as boxes. A line joining a role to an entity type indicates that the role is played by entities of that type. The name of the role is placed inside or beside the box.

Fact Type - A relationship between two entity types.

Example: The role "living at" describes the relationship between the entity types of "employee" and "address".

Reference Type - A relationship between a entity type and a label type. It provides a bridge between the objects and the labels. Example: The label type "surname" is used to identify an entity type, such as "employee".

30.3 Constraints on Objects and Roles - This Section lists various constraints or restrictions on objects and roles. The following conventions are used: a member or members of entity type A is designated as "A", a member or members of entity type B is designated as "B", and a member or members of entity type C is designated as "C".

a. Subtype Constraint - Subtype constraints are the rules which restrict the division of entity types into subtypes (subsets). A subtype shares (inherits) all properties of its supertype. A subtype is represented graphically by a single head arrow.

Subtype - Entity types B and C are subtypes of entity type A.
Entity type A is a common supertype of entity types B and C.
Entity type A can have zero, one or many subtypes.

Exclusion subtype - Entity types B and C are disjoint subsets of entity type A.
Example: Subtypes "male" and "female" are disjoint subsets of supertype "person".

Total subtype - All of the members of the supertype A are contained in the subtypes B and C. The subtypes B and C may intersect.

Example: All employees are either white collar or blue collar (or both).

b. Uniqueness Constraints - The uniqueness constraint is represented by placing a double headed arrow above or below the role box. Marking a single role with a uniqueness bar means that no duplicates of entries in the associated column of the population table are allowed. A uniqueness bar that spans a whole row means that each entry in the row is unique to the population table.

One to One - Each "A" relates to at most one "B". Each "B" relates to at most one "A". No duplications are allowed in either columns of the population table.

Example: A person may be leader of only one country. One country is headed by one leader.

Many to One - Each "A" relates to at most one "B".

No duplications are allowed in left column. Example: Many students can be enrolled in the one degree program, but a student may enroll in at most one degree program.

One to Many - Each "A" may relate to many "B".

No duplications are allowed in right column. Example: A degree program can be enrolled by many students.

Many to Many - Each "A" may relate to many "B". Each "B" may relate to many "A".

No duplications are allowed in combination of both columns.

Example: A student studies many subjects. A subject can be studied by many students. But a student cannot study the same subject twice.

c. Mandatory/Optional Constraints - A mandatory constraint specifies whether or not certain information must be recorded. It is indicated by placing a "V" on the line connecting the role to the entity type.

Mandatory - Each "A" relates to one and only one "B". Each "B" relates to one or many "A".

Example: The gender of every patient must be recorded and there is a patient of every gender.

Optional - Each "A" may relate to at most one "C". Each "C" may relate to many "A".

Example: A patient may or may not have a telephone.

d. Multiple Role Constraints - Multiple role constraints are shown as a line between the affected roles with a circle containing the constraint letter.

Joint uniqueness constraints - "B" playing role R1 with "A" and "C" playing role R2 with "A" are both required to uniquely identify "A". Example: Both "person" and "project" are required to complete the "job".

Exclusion constraints - Any "A" that is related to "B" through role R1 cannot be related to "C" through Role R2 and vice versa. Example: A person can either earn a salary or own a shop, but not both.

Subset constraints - "A" which play role R2 with "C" are a subset of "A" which play role R1 with "B". Example: A department can employ person only if that department has a budget, or the set of departments employing person is a subset of departments having budgets.

Equality constraints - All "A" that are related to "B" through role R1 also are related to "C" through role R2 and vice versa. Example: Every employee works for a department earns a salary and every employee who earns a salary must also work for a department.

Joint total constraints - "A" may play role R1 with "B". "A" may also play role R2 with "C". Example: A person live at the address has the same telephone number. (Inclusive OR)

e. Role Pair Constraints

Subset constraints -

Example: For any person the set of countries he visits is a subset of the set of countries he loves and for any countries the set of people who visit it is a subset of the people who love it.

Exclusive constraints -

Example: For any country the set of people who love it is disjoint from the set of people who hate it, and for any person, the set of countries he loves is disjoint from the set of countries he hates.

Appendix E - CDM/NIAM Conceptual Schema

50.1 CDM/NAIM Conceptual Schema Descriptions

The following are descriptions of the CDM Conceptual Diagrams contained in Section 50.2. This Section is derived from Section 40. The NIAM, Appendix C, is used as the modeling language.

50.1.1 CDM-ELEMENT (See Diagram (or Section) 50.2.1)

The CDM-ELEMENT is the top level data element of the CDM information model structure. All the elements in the CDM have the unique label type identifier "id". All the twelve subtype elements shown in this Diagram inherit this label type "id".

50.1.2 COMMON-ELEMENT (See Diagram 50.2.2)

All the thirty three subtype elements in this Diagram inherit these six common entity or label types ("refid", "name", "itemid", "type", "context" and "xref") in addition to the label type "id" which is inherited from COMMON-ELEMENT in Diagram 50.1.1.

The entity "refid" (reference identifier) is used by data elements to refer or "point" to other elements. Since "refid" is not unique, it may refer to several elements in the database. These referenced elements will have different "context" such as version number or security level (see Diagram 50.2.20) which will be used to determine which unique element is appropriate for a particular situation.

Most elements have a set of attributes ("name", "type", "itemid", and "xref") which describe the nature of the element's content. These include attributes defining the element's "name" and "type". There is also an "itemid" attribute used to indicate which piece of equipment (or "item") is related to the information element. The "itemid" could be a reference designator, a SSN number, a part number, etc., depending on the item of interest. There is also an attribute "xref" which defines relational links between the element and other elements in the database. An "xref" specifies the reference identifier for a related element and the type of relation being specified.

50.1.3 TECHINFO, SYSTEM, OPERINFO and DESCINFO (See Diagram 50.2.3)

The "techinfo" element is the top element of the CDM technical information. Its content is a long list of data elements which comprise the raw data "records" or "tables" of the CDM database.

The "system" element of the database is the root, or top level in the system/end-item hierarchy.

The CDM specifies a hierarchically organized database of technical information for a weapon system. The main hierarchy of the database parallels the equipment hierarchy of the weapon system. This is normally

represented as a vehicle - system - subsystem - subassembly hierarchy in Technical Orders. That hierarchy is represented in the CDM by the "system" element specified. Here "system" is used in its most generic sense, meaning any component or item in the equipment hierarchy. A "system" could represent the vehicle, an aircraft system, subsystem, or subassembly.

At any level in this hierarchy, elements may reference associated information. They may reference procedural task information ("task"), descriptive information ("descinfo"), parts information ("partinfo"), fault information ("faultinf"), or operational information ("operinfo"). This information should be attached to the level where it is most appropriate. For example, vehicle towing procedures should be referenced at the "vehicle" level. The removal task for a circuit card in the radar should be referenced at the radar "system" level.

The element "descinfo" is used to define general purpose, non-procedural, narrative information such as theory of operation, schematics, wiring diagrams, etc. "descinfo" is a very flexible, general purpose information node. It can be used to describe any arbitrary, hierarchical hypertext-like node containing sub-paragraphs ("descinfo"), data ("text", "table", "graphic", "annot", "audio", "video", or "process"), user interaction instructions ("prompt"), and assertion properties ("assertion") which are asserted whenever "descinfo" is read.

50.1.4 TASK, REQCOND, PERSON, WARNING, CAUTION, NOTE and VERB (See Diagram 50.2.4)

The elements "task", and "step" define a maintenance task or procedure. A "task" consists of a list of steps ("step"), a list of followon tasks ("followon"), and the attributes estimated time ("esttime") and action describing "verb". The elements "reqcond" (required conditions), "person" (personnel required), "equip" (equipment required), and "consum" (consumables). The additional elements "warning", "caution", "note", and "annot" (user annotations) are referenced by "step".

50.1.5 STEP, EQUIP and ANNOT (See Diagram 50.2.5)

See above Section 50.1.4 above.

50.1.6 PROMPT, FILLIN, MENU and CHOICE (See Diagram 50.2.6)

A "prompt" specifies either a fill-in-the-blank ("fillin") or menu choice ("menu") question for the user. Prompts are characterized in terms of property-value pairs similar to assertions and preconditions). Basically, each prompt is associated with a "property" which specifies the property which will be asserted along with the user's response when the prompt is answered. If the prompt is a "fillin" the user's response will be asserted as the "value" of the specified "property". If the prompt is a "menu", the user's "choice" selection from the menu will have an associated "value" which will be asserted as the "value" of the prompt's "property". Once this assertion is made, other elements

in the system may use the information to test preconditions ("precond") concerning the asserted property.

The "text" of a prompt is the question which will be displayed to the user. The "text" of a "choice" is the list of possible menu selections which will be displayed to the user.

Both "fillin" and "menu" prompts can have a "default" value. In the case of a "fillin", the "default" is a text string which will be used as the initial entry in the fill-in-the-blank form. In the case of a "menu", the default will be an "address" of the possible "choice" responses.

50.1.7 PRECOND (See Diagram 50.2.7)

"precond" and "assertion" are both defined in terms of property-value pairs. A "property" is any "text" string which defines a property. A "value" is another "text" string which defines a value. Property-pairs may be asserted or tested by the run time presentation software. An "assertion" on a step will be asserted whenever that step is performed. A "precond" is a test of a property previously asserted. The property element also has an optional "elmtref" attribute used to indicate a prompt or task which can be activated to acquire a value for the property if none has been asserted.

50.1.8 ASSERTION, PROPERTY and VALUE (See Diagram 50.2.8)

See above Section 50.1.7 above.

50.1.9 AUDIO, VIDEO and PROCESS (See Diagram 50.2.9)

The elements "audio", "video", and "process" are references to either a file name or an external source which contains an audio sequence, a video sequence, or a software process, respectively.

50.1.10 TEXT and DICTITEM (See Diagram 50.2.10)

"text" is the primitive text element referenced by more complex data elements of the CDM. A "text" unit is basically a text string of "parsable character data" (#PCDATA). Within a text string, attribute values ("attvalue") of other CDM elements may be referenced and inserted as text strings. For example, the string may contain a reference to a standard system name, or a standard part nomenclature, or a standard task name. "attvalue" may be used to embed one of these references in a string which tells the display system to find the value of the referenced attribute and place that value into the text string for display. By using this mechanism, standard terminology can be referenced consistently throughout the database, and any changes to the standard terminology can be made in one location and automatically updated throughout the database.

50.1.11 COMSUM (See Diagram 50.2.11)

The "consum" element defines the consumables required in the maintenance "step" procedures.

50.1.12 TABLE, COLHDDEF and ENTRY (See Diagram 50.2.12)

The elements "table", "colhddef", and "entry" define the structure for a table of information. The cells or "entries" of a table may be a "text" unit or any element identified by an "refid".

50.1.13 GRAPHIC (See Diagram 50.2.13)

The CDM allows graphics to be referenced from external graphics files or embedded graphics files in the CDM database. The element "grphprim" may contain a "file" name which identifies an external file containing a graphic data in any of the enumerated formats (cgm, iges, dxf, fax, etc.). The same graphic data may also be included directly in the CDM by putting the data in the "#PCDATA" content portion of a "grphprim" element.

Both "graphic" and "grphprim" have a set of optional attributes to specify transformations (i.e., scaling, translating, rotating, clipping, etc.). A "graphic" or "grphprim" element may specify a transformation matrix ("transform"), a clipping ("window"), a pen shape ("penshape"), a pen pattern ("penpatt"), and a label ("text"). Transformations ("transfrm") are specified by a 9-number transformation matrix which specifies coordinate translation, scaling, reflection, and rotation in terms of homogeneous coordinates.

Composite graphics may be constructed by grouping transformed graphics ("graphic" or "grphprim") into "graphic" elements. These transformed, labeled, named, and typed graphic illustrations are then referenced by steps in the CDM. A composite "graphic" may also specify a list of "focus" objects which are the subgraphics of interest for that particular illustration. This attribute could be used to specify which subgraphics in an illustration are to be highlighted, labeled, etc., by the presentation software.

"graphic" and "grphprim" also may specify a minimum size ("minsize") required to satisfactorily display the graphic to the user. The minimum size is specified in terms of the visual angle the graphic image should subtend on the viewer's eye. This will allow different display systems with different viewing distances to adjust the physical size of the graphic to provide the correct visual image intended by the author.

50.1.14 GRPHPRIM (See Diagram 50.2.14)

See above Section 50.1.13 above.

50.1.15 FAULTINFO, TEST, and OUTCOME (See Diagram 50.2.15)

Three types of fault information can be described in the CDM:
(1) fault reporting decision trees, (2) fault isolation decision trees,

and (3) dynamic fault isolation models (such as AFHRL's MDAS model). The fault reporting and isolation decision trees are static, predefined decision sequences. A dynamic fault model generates the decision sequence at display time from a fault model of the equipment. In the case of a decision tree, the complete tree is defined in the data. In the case of a dynamic fault isolation model, only the data needed to represent the fault model of the equipment is defined in the data.

Any of these diagnostic data structures can be described in terms of diagnostic tests ("test"), test outcomes ("outcome"), fault states ("fltstate"), repairable faults ("fault"), and fault rectification actions ("rect"). You begin a fault reporting or isolation process with a "test", which may be as simple as "what symptoms did you observe?", or as complex as a 50-step checkout procedure. Each "test" will have associated "outcomes" which associate possible test results with new fault states ("fltstate"). Test results are described as "precond" statements (e.g, voltage = 4.5v, light = dim, faultcode = A123, ...) which are asserted by the "test" procedure as the test is performed. The "outcome" elements relate those possible test results to fault states.

A "fltstate" state represents a node in a fault isolation decision tree or a set of plausible faults in a dynamic fault model. A "fltstate" state provides the information necessary to select the next diagnostic test. In a decision tree the test is explicitly identified by the "test" attribute of "fltstate". In a dynamic fault model, the "test" is not explicitly identified since the "test" attribute is empty, and the "fltstate" specifies a list of implicated faults ("impfault") and a list of exculpated faults ("expfault") for that state. Implicated faults are those states which are suspected to be bad in the fault state. Exculpated faults are those states known to be good in the fault state. These fault lists are then used by dynamic software to generate a list of appropriate "tests" which will further isolate the list of implicated faults. No matter how the test is selected, statically by the data or dynamically by the software, the selected "test" is performed and the process continues until a fault is isolated. In a decision tree, a fault is identified when you reach a final "fltstate" node which does not reference a "test", but lists the identified "fault". In a dynamic fault model, the final fault is identified by the software and is not explicitly represented by the "fltstate" element.

Once a "fault" is identified, the rectification or repair procedure ("rect") associated with the "fault" is performed. A rectification action also has an associated "test" which is generally a checkout task to verify that the rectification action successfully fixed the problem. The "rect" element also has a fault attribute which is a list of faults repaired by the rectification action.

Tests and rectifications can be performed by a human or machine agent. The elements "test" and "rect" have an "agent" attribute which states whether the action is performed by a human or a machine.

50.1.16 FAUL, FLTSTATE and RECT (See Diagram 50.2.16)

See above Section 50.1.15 above.

50.1.17 PARTINFO (See Diagram 50.2.17)

The elements "partinfo" and "partbase" define detailed parts information. "partinfo" describes an item by its reference designator ("refdes") which categorizes parts by their place in the system-subsystem hierarchy. "partinfo" describes the maintainer's view of the part information. Each "partinfo" element is related to a "partbase" which describes the item in terms of its part number ("partnum"). "partbase" describes the supply system's view of the part information. Several "partinfo" items could be related to the same "partbase".

50.1.18 PARTBASE (See Diagram 50.2.18)

See above Section 50.1.17 above.

50.1.19 CONTEXT (See Diagram 50.2.19)

Every CDM composite object also has context. Vehicle configuration, security level, and technician skill level are examples of context properties which determine the applicability of a particular data element to the situation at hand. "context" consists of a set of frequently used "effectively" attributes (security, ..., config, version), as well as a list of user defined "precond" (preconditions).

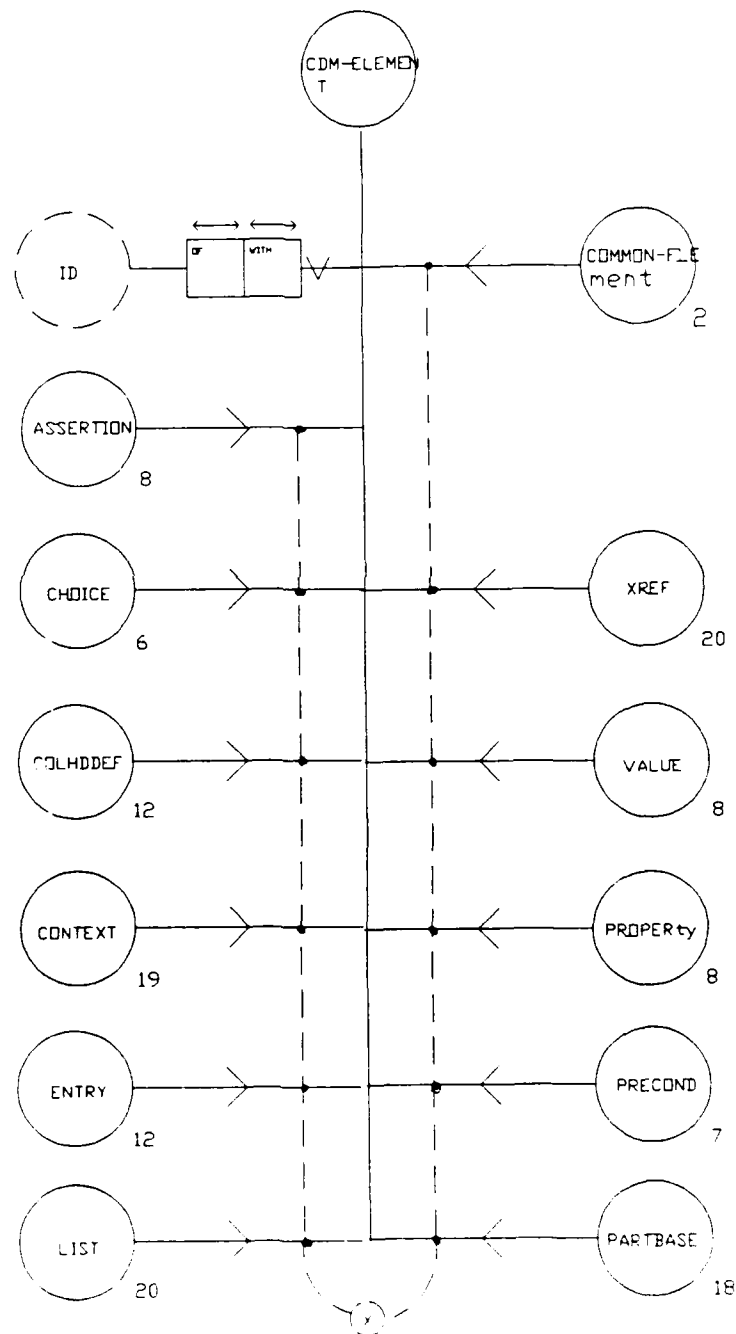

50.1.20 XREF and LIST (See Diagram 50.2.20)

The element "xref" defines a cross-reference or relational link. Each cross-reference has at least one internal reference or an external reference of the CDM. Internal references are represented by "elmtref" which is a reference id for any CDM element. External references are indicated by "exrefid" which is character data describing another file or database element. All cross references may have a type ("relation") which is a text string describing the nature of the reference (e.g., "theory", "IPB", "schematic", etc.). There is an optional attribute "attname" which may be used to narrow the "xref" to a particular attribute value of the cross-referenced element.

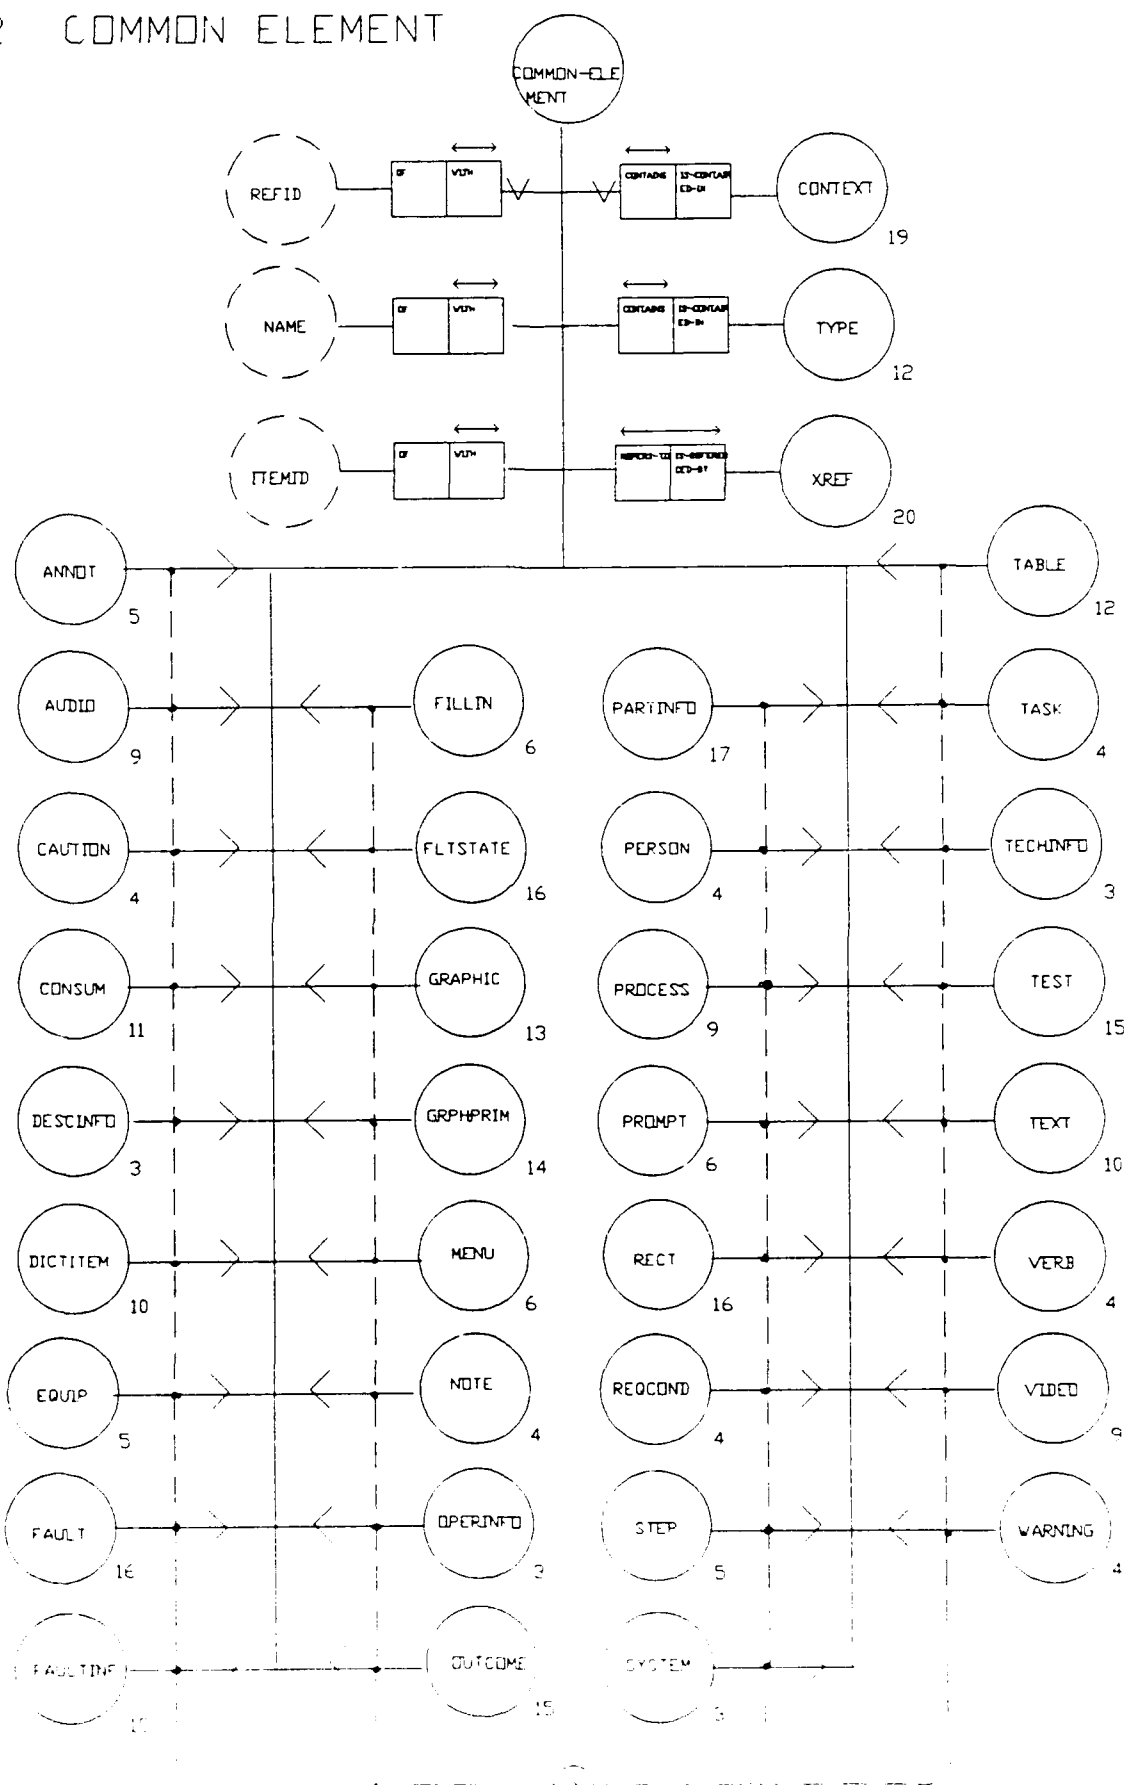

A "list" is a general purpose structure used to group individual elements into a list of elements which share a common context. For example, if you wanted to specify that a list of steps were all to be performed if a certain precondition were true, you could group those steps into a list with a single context which specified the desired precondition.

Appendix F - CDM/NIAM Data Dictionary

60.1 Scope: This Data Element Dictionary contains all the data elements (entities and attributes) of the CDM, and defines the relationships between them. The data elements in this Appendix are presented by the NIAM information analysis model in graphics form in Section 50.2 of Appendix E, interpreted in a neutral data model in a topographical form in Section 70.1 of Appendix G, presented in ORACLE-SQL database schema definition language in Section 80.1 of Appendix H, and finally expressed in Express information modeling language in Section 90 of Appendix I.

Each Data Element Definition (DED) entry contains some or all of the following items:

- a. Data Element Definition Number - DED Number.
- b. Data Element Definition Name - DED Name.
- c. Data Element Definition - DED.
- d. Data Element Field Format - Data format.
- e. Data Element Description - Description.
- f. Attribute of
- g. Entity Type Relationships/Constraints or
Label Type Descriptions/Constraints
- h. NIAM Diagram Number
- i. Example(s)

60.2 Data Element Dictionary Format. The general format for each entry of the Data Element Dictionary is as follows:

DED Number DED Name - DED

Data Format:

Description:

Attribute of:

Entity Type Relationships/Constraints: NIAM Diagram Number
or Label Type Descriptions/Constraints:

Example(s):

The terms used in the general format description above are defined below:

60.2.1 DED Number: A sequentially assigned number used to locate and reference each data element in the dictionary.

60.2.2 DED Name: The term used to uniquely identify the data element.

60.2.3 DED: A short phrase used to define and describe the data element.

60.2.4 Data Format (for label type only): Specifies the length type.

positional justification, and decimal placement for a data element field or subfield thereof as described below:

a. Length: The number of maximum characters is specified.

b. Type: Specifies the character type, wherein:

A - all characters are alphabetical.

N - all characters are numerical.

X - characters are alphanumeric, special or any combination.

D - characters are real numbers in floating decimal format.

c. Justification: Specifies from which side of the field the data element characters are entered. For example, those starting at the left are left justified (L).

L - left justified.

R - right justified.

F - fixed, occupying the entire field.

d. Decimal Placement: Specifies the number of character positions to the right of the assumed decimal point when the data element characters are all numerical. A dash (-) is used if this column is not applicable.

e. NARRATIVE Field format: An extended narrative data field holding a maximum of 65,536 text characters.

60.2.5 Data Element Description: A narrative definition of the data element in sufficient detail to present a clear and complete understanding of the precise data or element of information that the data element represents.

60.2.6 Attribute of: Identifies those entities with which this data element is an attribute of. The attribute represents a property, or characteristic of the entity.

60.2.7 Entity Type Relationships/Constraints or Label Type Descriptions/Constraints - Specifies whether the data element is of entity type or label type. For detailed definitions of entity type, label type, as well as relationships and constraints, see Appendix C.

The "sentences" which follow the "Entity Type Relationships/Constraints" or "Label Type Descriptions/Constraints" headings in Section 3.2 are generated by the IAST software tool.

60.2.8 NIAM Diagram Number: Specifies NIAM diagrams in Appendix C, Section 30.2 in which the data element appears.

60.2.9 Example(s): Provides relevant examples.

60.3 Data Element Definition:

001 ACTION - Maintenance Fault Rectification Action

Description: Describes the type of maintenance action required to rectify or fix a fault. The action can be a "SWAP" which means it is a removal/replacement action, or it can be a "MAINT" action which means it is an adjustment, alignment, etc. action.

Attribute of: RECT

Entity Type Relationships/Constraints: See Section 50.2.16

An ACTION is an entity type.

An ACTION may be IDENTIFIED-BY any number of RECT's.

An ACTION must be WITH exactly one ACTION-CODE.

002 ACTION-CODE - A Label Type of ACTION

Data Format: 5 A L

Label Type Descriptions/Constraints: See Section 50.2.16

An ACTION-CODE is a label type with representation Character 5.

An ACTION-CODE may be OF at most one ACTION.

Example(s): "swap" or "maint"

003 AGENT - Performer Of Fault Isolation

Description: Designates whether a maintenance action (e.g. a test or a rectification action) is performed by a human or machine.

Attribute of: RECT, TEST

Entity Type Relationships/Constraints: See Section 50.2.15

An AGENT is an entity type.

An AGENT may PERFORM any number of RECT's.

An AGENT may PERFORM any number of TEST's.

An AGENT must be WITH exactly one AGENT-ID.

004 AGENT-ID - A Label Type of AGENT

Data Format: 7 A L

Label Type Descriptions/Constraints: See Section 50.2.15

An AGENT-ID is a label type with representation Character 7.

An AGENT-ID may be OF at most one AGENT.

Example(s): "human" or "machine"

005 ANNOT - User Annotation

Description: References a comment or note from the technician.

Annotations can refer to descriptive information or a specific step within a procedural task.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.5

An ANNOT is an entity type.

An ANNOT is a subtype of COMMON-ELEMENT.

An ANNOT may be ANNOTED-BY at most one USER.

An ANNOT must DISPLAY exactly one TEXT.

An ANNOT may be CONTAINED-IN any number of STEP's.

An ANNOT may be REFERENCED-BY any number of DESCINFO's.

006 ASSERTION - Assertion

Description: An assertion is a fact defined in terms of a PROPERTY-VALUE pair which expresses an author defined property to be "asserted" as the system processes the STEP or DESCINFO in question.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.8

An ASSERTION is an entity type.

An ASSERTION is a subtype of CDM-ELEMENT.

An ASSERTION must ASSERT exactly one PROPERTY.

An ASSERTION must ASSERT one or more VALUE's.

An ASSERTION may be ASSERTED-BY any number of DESCINFO's.

An ASSERTION may be ASSERTED-BY any number of STEP's.

007 ATNAME - A Label Type of ATNAME

Data Format: 80 A L

Label Type Descriptions/Constraints: See Section 50.2.10

An ATNAME is a label type with representation Character 80.

An ATNAME may be OF at most one ATNAME.

008 ATT-VALUE - A Label Type of ATTVALUE

Data Format: 80 A L

Label Type Descriptions/Constraints: See Section 50.2.10

An ATT-VALUE is a label type with representation Character 80.

An ATT-VALUE may be OF at most one ATTVALUE.

009 ATTNAME - Attribute Name

Description: Represents an attribute value of a cross-referenced element so as to "focus" the scope of the reference.

Attribute of: ATTVALUE, XREF

Entity Type Relationships/Constraints: See Section 50.2.10

An ATTNAME is an entity type.

An ATTNAME may be OF any number of ATTVALUE's.

An ATTNAME may be OF any number of XREF's.

An ATTNAME must be WITH exactly one ATNAME.

010 ATTVALUE - Attribute Value

Description: Identifies the values of other CDM element attributes. This will allow a standard terminology to be referenced consistently throughout the database, as a result changes to standard terms can be made in one location and automatically be updated throughout the database.

Attribute of: TEXT

Entity Type Relationships/Constraints: See Section 50.2.10

An ATTVALUE is an entity type.

An ATTVALUE must HAVE exactly one ATTNAME.

An ATTVALUE may be CONTAINED-IN any number of TEXT's.

An ATTVALUE must be REFERRED to exactly one ELMNTREF.

An ATTVALUE must be WITH exactly one ATT-VALUE.

011 AUDIO - Audio Data

Description: References an external audio sequence which may be represented as a file or some other external reference.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.9

An AUDIO is an entity type.

An AUDIO is a subtype of COMMON-ELEMENT.

An AUDIO may be INVOKED-BY any number of DESCINFO's.

An AUDIO may be INVOKED-BY any number of STEP's.

An AUDIO may REFER-TO at most one EXREFID.

An AUDIO may REFER-TO at most one FILE.

012 CAGE - Commercial and Government Entity

Description: Represents a commercial and government entity number. A five digit number assigned by the Defense Logistic Services Center (DLSC) to the design control activity or actual manufacturer of an item contained in the Cataloguing Handbook H4/H8 series.

Attribute of: PARTBASE

Entity Type Relationships/Constraints: See Section 50.2.18

A CAGE is an entity type.

A CAGE may be OF any number of PARTBASE's.

A CAGE must be WITH exactly one CAGE-CODE.

013 CAGE-CODE - A Label Type of CAGE

Data Format: 5 A F

Label Type Descriptions/Constraints: See Section 50.2.18

A CAGE-CODE is a label type with representation Character 5.

A CAGE-CODE may be OF at most one CAGE.

014 CAUTION - Caution

Description: References a caution that is associated with a particular task or step. A caution notifies the technician that the task or step may harm the equipment if not properly performed.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

A CAUTION is an entity type.

A CAUTION is a subtype of COMMON-ELEMENT.

A CAUTION must DISPLAY exactly one TEXT.

A CAUTION may be REFERENCED-BY any number of STEP's.

A CAUTION may be REFERENCED-BY any number of TASK's.

015 CDM-ELEMENT - CDM Element

Description: Represents the root of the CDM element hierarchical structure.

Attribute of: None

Entity Type Relationships/Constraints: See Section 50.2.1

A CDM-ELEMENT is an entity type.

A CDM-ELEMENT may be ALSO-CALLED at most one ELMNTREF.

A CDM-ELEMENT must be WITH exactly one ID.

The following subtypes of the CDM-ELEMENT are mutually exclusive: ASSERTION, CHOICE, COLHDDEF, COMMON-ELEMENT, CONTEXT, ENTRY, LIST, PARTBASE, PRECOND, PROPERTY, VALUE, and XREF.

016 CHOICE - Choice Of A Menu

Description: References the text to be displayed to the user in the list of possible selections within a menu.

Attribute of: MENU

Entity Type Relationships/Constraints: See Section 50.2.6

A CHOICE is an entity type.

A CHOICE is a subtype of CDM-ELEMENT.

A CHOICE must CONTAIN one or more VALUE's.

A CHOICE must DISPLAY exactly one TEXT.

A CHOICE may be OF any number of MENU's.

017 CODING - Graphics Codes

Description: References the particular type of graphic file (e.g. IGES, CGM, etc.) that the current graphic is stored.

Attribute of: GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.14

A CODING is an entity type.

A CODING may be SPECIFIED-BY any number of GRPHPRIM's.

A CODING must be WITH exactly one CODING-CODE.

018 CODING-CODE - A Label Type of CODING

Data Format: 80 X L

Label Type Descriptions/Constraints: See Section 50.2.14

A CODING-CODE is a label type with representation Alphanumeric 80.

A CODING-CODE may be OF at most one CODING.

Example(s): "cgmchar", "cgmbin", "cgmclean", "fax", "iges", "dxf" or "gks".

019 COL - Table Entry Column

Description: Represents the specific column of a table where the current entry belongs.

Attribute of: ENTRY

Entity Type Relationships/Constraints: See Section 50.2.12

A COL is an entity type.

A COL may be CONTAINED-IN any number of ENTRY's.

A COL must be WITH exactly one COL-NUMBER.

020 COL-NUMBER - A Label Type of COL

Data Format: 4 N R

Label Type Descriptions/Constraints: See Section 50.2.12

A COL-NUMBER is a label type with representation Numeric 4.

A COL-NUMBER may be OF at most one COL.

021 COLHDDEF - Column Heading Definition.

Description: Identifies the column heading definitions portion of a table.

Attribute of: TABLE

Entity Type Relationships/Constraints: See Section 50.2.12

A COLHDDEF is an entity type.

A COLHDDEF is a subtype of CDM-ELEMENT.

A COLHDDEF must CONTAIN exactly one COLNUM.

A COLHDDEF may CONTAIN at most one TYPE.

A COLHDDEF may be CONTAINED-IN any number of TABLE's.

A COLHDDEF must have exactly one COLHDDEF-NAME.

022 COLHDDEF-NAME - A Label Type of COLHDDEF

A COLHDDEF-NAME is a label type with representation Alphanumeric 20.

Label Type Descriptions/Constraints: See Section 50.2.12

A COLHDDEF-NAME is a label type with representation Alphanumeric 20.

A COLHDDEF-NAME may be OF at most one COLHDDEF.

023 COLNUM - Column of a Table

Description: Represents the column number(s) within the table to which the current element refers.

Attribute of: COLHDDEF

Entity Type Relationships/Constraints: See Section 50.2.12

A COLNUM is an entity type.

A COLNUM may be CONTAINED-IN any number of COLHDDEF's.

A COLNUM must be WITH exactly one COLNUM-NUMBER.

024 COLUMN-NUMBER - A Label Type of COLUMN

Data Format: 2 N R

Label Type Descriptions/Constraints: See Section 50.2.12

A COLNUM-NUMBER is a label type with representation Numeric 2.

A COLNUM-NUMBER may be OF at most one COLNUM.

025 COMMON-ELEMENT - Common Element

Description: Specifies those elements (entity types) which share the following entity/label types: REFID, NAME, ITEMID, TYPE, CONTEXT, and XREF.

Attribute of: None

Entity Type Relationships/Constraints: See Section 50.2.2

A COMMON-ELEMENT is an entity type.

A COMMON-ELEMENT is a subtype of CDM-ELEMENT.

A COMMON-ELEMENT must CONTAIN exactly one CONTEXT.

A COMMON-ELEMENT may CONTAIN at most one TYPE.

A COMMON-ELEMENT may REFER-TO any number of XREF's.

A COMMON-ELEMENT may be WITH at most one ITEMID.

A COMMON-ELEMENT may be WITH at most one NAME.

A COMMON-ELEMENT must be WITH exactly one REFID.

The following subtypes of the COMMON-ELEMENT are mutually exclusive: ANNOT, AUDIO, CAUTION, CONSUM, DESCINFO, DICTITEM, EQUIP, FAULT, FAULTINF, FILLIN, FLTSTATE, GRAPHIC, GRPHPRIM, MENU, NOTE, OPERINFO, OUTCOME, PARTINFO, PERSON, PROCESS, PROMPT, RECT, REQCOND, STEP, SYSTEM, TABLE, TASK, TECHINFO, TEST, TEXT, VERB VIDEO, and WARNING.

026 CONFIG - Configuration.

Description: Represents the configuration of the current system being maintained. It allows the system to automatically choose the correct path with regard to the configuration which has been entered into the system. It based on effectivity codes in current technical orders.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A CONFIG is an entity type.

A CONFIG may be OF any number of CONTEXT's.

A CONFIG must be WITH exactly one CONFIG-DATA.

027 CONFIG-DATA

Data Format: 20 X L

Label Type Descriptions/Constraints: See Section 50.2.19

A CONFIG-DATA is a label type with representation Alphanumeric 20.

A CONFIG-DATA may be OF at most one CONFIG.

028 CONSUM - Consumable Supply

Description: Identifies information about a consumable required for a particular STEP.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.11

A CONSUM is an entity type.

A CONSUM is a subtype of COMMON-ELEMENT.

A CONSUM must HAVE exactly one QTY.

A CONSUM may be REQUIRED-BY any number of STEP's.

A CONSUM may be REQUIRED-BY any number of TASK's.

A CONSUM must BE-SPECIFIED-BY exactly one GOVSTD.

A CONSUM must BE-SPECIFIED-BY exactly one MFGCODE.

A CONSUM must BE-SPECIFIED-BY exactly one MILSPEC.

A CONSUM must BE-MEASURED-BY exactly one UOM.

029 CONTEXT - Effectivity Analysis

Description: References both a set of frequently used effectivity

attributes and a list of user defined preconditions to ensure a proper transversal of database information to provide the correct information to the technician for the current system being maintained/repaired.

Attribute of: COMMON-ELEMENT

Entity Type Relationships/Constraints: See Section 50.2.19

- A CONTEXT is an entity type.
- A CONTEXT is a subtype of CDM-ELEMENT.
- A CONTEXT may CONTAIN any number of CONFIG's.
- A CONTEXT may CONTAIN at most one MAINTLVL.
- A CONTEXT may CONTAIN any number of RELEASF's.
- A CONTEXT may CONTAIN at most one SECURITY.
- A CONTEXT may CC.NTAIN any number of TRACK's.
- A CONTEXT may CONTAIN at most one VALSTAT.
- A CONTEXT may CONTAIN any number of VERSION's.
- A CONTEXT may CONTAIN at most one VERSTAT.
- A CONTEXT may BE-CONTAINED-IN any number of COMMON-ELEMENT's.
- A CONTEXT may TEST any number of PRECOND's.

030 DEFAULT - Default Menu Choice or Fill-in-the-Blank Response

Description: Represents a text string which will be used as the initial entry in the fill-in-the-blank form. In case of "MENU", the default is a pointer to one of the possible "CHOICE" responses.

Attribute of: FILLIN, MENU

Entity Type Relationships/Constraints: See Section 50.2.6

- A DEFAULT is an entity type.
- A DEFAULT may be OF any number of FILLIN's.
- A DEFAULT may be OF any number of MENU's.
- A DEFAULT must be WITH exactly one DEFAULT-DATA.

031 DEFAULT-DATA - A Label Type of DEFAULT

Data Format: 80 A L

Label Type Descriptions/Constraints: See Section 50.2.6

- A DEFAULT-DATA is a label type with representation Character 80.
- A DEFAULT-DATA may be OF at most one DEFAULT.

032 DESCINFO - Descriptive Information

Description: Defines general purpose, non-procedural, or narrative information such as theory of operation, schematics, wiring diagrams, etc. It is a very flexible, general purpose information entity.

Attribute of: DESCINFO, OPERINFO, SYSTEM

Entity Type Relationships/Constraints: See Section 50.2.3

- A DESCINFO is an entity type.
- A DESCINFO is a subtype of COMMON-ELEMENT.
- A DESCINFO may ASSERT any number of ASSERTION's.
- A DESCINFO may DISPLAY any number of GRAPHIC's.
- A DESCINFO may DISPLAY at most one TEXT.
- A DESCINFO may INVOKE any number of AUDIO's.
- A DESCINFO may INVOKE any number of PROCESS's.
- A DESCINFO may INVOKE any number of VIDEO's.
- A DESCINFO may be SUB-DESCINFO-OF any number of DESCINFO's.
- A DESCINFO may BE-REFERENCED-BY any number of OPERINFO's.
- A DESCINFO may BE-REFERENCED-BY any number of SYSTEM's.
- A DESCINFO may PRESENT any number of PROMPT's.
- A DESCINFO may PRESENT any number of TABLE's.
- A DESCINFO may REFER-TO any number of ANNOT's.
- A DESCINFO may REFER-TO any number of DESCINFO's.

033 DICTITEM - Dictionary Item

Description: References an element which allows the creation of a dictionary of terms used in the database and which can be employed in a help function later in the presentation system.

Attribute of: NONE

Entity Type Relationships/Constraints: See Section 50.2.10

- A DICTITEM is an entity type.
- A DICTITEM is a subtype of COMMON-ELEMENT.
- A DICTITEM must REFER-TO one or more ELMNTREF's.

034 ELMNTREF - Element Reference

Description: A reference to an element of any type. In some cases, CDM elements may need to refer to or link a mixture of element types.

Attribute of: ATTVALUE, DICTITEM, ENTRY, LIST, PROPERTY, REQCOND, and XREF

Entity Type Relationships/Constraints: See Section 50.2.20

- An ELMNTREF is an entity type.
- An ELMNTREF may BE-REFERENCED-BY any number of DICTITEM's.
- An ELMNTREF may BE-REFERENCED-BY any number of ATTVALUE's.
- An ELMNTREF may BE-REFERENCED-BY any number of ENTRY's.
- An ELMNTREF may BE-REFERENCED-BY any number of LIST's.
- An ELMNTREF may BE-REFERENCED-BY any number of PROPERTY's.
- An ELMNTREF may BE-REFERENCED-BY any number of REQCOND's.
- An ELMNTREF may BE-REFERENCED-BY any number of XREF's.
- An ELMNTREF must be SAME-AS exactly one CDM-ELEMENT.

035 ENTRY - Table entry

Description: References the cells or parts of a table which may take the form of text or any other internal element.

Attribute of: TABLE

Entity Type Relationships/Constraints: See Section 50.2.12

- An ENTRY is an entity type.
- An ENTRY is a subtype of CDM-ELEMENT.
- An ENTRY must CONTAIN exactly one COL.
- An ENTRY must CONTAIN exactly one ROW.
- An ENTRY may DISPLAY at most one TEXT.
- An ENTRY may BE-CONTAINED-IN any number of TABLE's.
- An ENTRY may REFER-TO at most one ELMNTREF.

036 EQUIP - Maintenance Equipment

Description: Identifies the equipment needed to perform a particular task or step. Usually refers to a piece of test equipment.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.5

- An EQUIP is an entity type.
- An EQUIP is a subtype of COMMON-ELEMENT.
- An EQUIP may be ALT-EQUIP-OF any number of EQUIP's.
- An EQUIP must HAVE exactly one QTY.
- An EQUIP may BE-REQUIRED-BY any number of STEP's.
- An EQUIP may BE-REQUIRED-BY any number of TASK's.

037 ESTTIME - Estimated Time for Completion

Description: Represents the amount of time required for the corresponding task/step to be completed.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

- An ESTTIME is an entity type.
- An ESTTIME may BE-REQUIRED-BY any number of STEP's.
- An ESTTIME may BE-REQUIRED-BY any number of TASK's.
- An ESTTIME must be WITH exactly one TIME.

038 EXREF-ID - A Label Type of EXREFID

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.20

- An EXREF-ID is a label type with representation Alphanumeric 10.
- An EXREF-ID may be OF at most one EXREFID.

039 EXREFID - External Reference

Description: Represents an external reference that is an element

in another file or database, external to the Content Data Model.

Attribute of: AUDIO, PROCESS, VIDEO, XREF

Entity Type Relationships/Constraints: See Section 50.2.20

An EXREFID is an entity type.

An EXREFID may BE-REFERENCED-BY any number of AUDIO's.

An EXREFID may BE-REFERENCED-BY any number of PROCESS's.

An EXREFID may BE-REFERENCED-BY any number of VIDEO's.

An EXREFID may BE-REFERENCED-BY any number of XREF's.

An EXREFID must be WITH exactly one EXREF-ID.

040 FAULT - Fault

Description: References a potential failure which may occur within a system.

Attribute of: FAULTINF, RECT

Entity Type Relationships/Constraints: See Section 50.2.16

A FAULT is an entity type.

A FAULT is a subtype of COMMON-ELEMENT.

A FAULT may DISPLAY at most one TEXT.

A FAULT may be EXCULPATING any number of FLTSTATE's.

A FAULT may be IMPLICATING any number of FLTSTATE's.

If a FAULT is EXCULPATING a FLTSTATE,

then that same FAULT cannot be IMPLICATING that same FLTSTATE.

A FAULT may HAVE at most one MTBF.

A FAULT must IDENTIFY one or more RECT's.

A FAULT may BE-IDENTIFIED-BY any number of FAULTINF's.

A FAULT may POINT-TO any number of PARTINFO's.

041 FAULTINF - Fault Information Data

Description: References the collection of all faults and tests which pertain to a given system.

Attribute of: FAULTINF, SYSTEM

Entity Type Relationships/Constraints: See Section 50.2.15

A FAULTINF is an entity type.

A FAULTINF is a subtype of COMMON-ELEMENT.

A FAULTINF must IDENTIFY one or more FAULT's.

A FAULTINF must IDENTIFY one or more TEST's.

A FAULTINF may BE-REFERENCED-BY any number of SYSTEM's.

042 FILE - Data File

Description: Represents the name of an external file which may contain graphics, audio, video, or software information.

Attribute of: AUDIO, GRPHPRIM, PROCESS, VIDEO

Entity Type Relationships/Constraints: See Section 50.2.14

- A FILE is an entity type.
- A FILE may BE-REFERENCED-BY any number of AUDIO's.
- A FILE may BE-REFERENCED-BY any number of GRPHPRIM's.
- A FILE may BE-REFERENCED-BY any number of PROCESS's.
- A FILE may BE-REFERENCED-BY any number of VIDEO's.
- A FILE must be WITH exactly one FILE-DATA.

043 FILE-DATA - A Label Type of FILE

Data Format: 80 X L

Label Type Descriptions/Constraints: See Section 50.2.14

- A FILE-DATA is a label type with representation Alphanumeric 80.
- A FILE-DATA may be OF at most one FILE.

044 FILLIN - Fill-in-the-blank

Description: References a fill-in-the-blank form which will be displayed to the technician. This element can have a default text string for its initial entry in the fill-in-the-blank form.

Attribute of: PROMPT

Entity Type Relationships/Constraints: See Section 50.2.6

- A FILLIN is an entity type.
- A FILLIN is a subtype of COMMON-ELEMENT.
- A FILLIN must ASSERT exactly one PROPERTY.
- A FILLIN may HAVE at most one DEFAULT.
- A FILLIN must DISPLAY exactly one TEXT.
- A FILLIN may be OF any number of PROMPT's.

045 FLTSTATE - Fault State

Description: References a list of faults (i.e. an ambiguity group) which are implicated in the fault state. It provides information necessary to select the next diagnostic test, which may be done explicitly in a decision tree or by the software in a dynamic model.

Attribute of: FLTSTATE, OUTCOME

Entity Type Relationships/Constraints: See Section 50.2.16

- A FLTSTATE is an entity type.
- A FLTSTATE is a subtype of COMMON-ELEMENT.
- A FLTSTATE may DISPLAY at most one TEXT.
- A FLTSTATE may be EXCULPATED-BY any number of FAULT's.
- A FLTSTATE may be IMPLICATED-BY any number of FAULT's.
- If a FLTSTATE is EXCULPATED-BY a FAULT,
then that same FLTSTATE may not be IMPLICATED by that same FAULT.
- A FLTSTATE may IDENTIFY at most one TEST.
- A FLTSTATE may be IDENTIFIED-BY any number of OUTCOME's.

A FLTSTATE may be SCALED-BY any number of WEIGHT's.

046 FOLLOWON - Follow on Task

Description: References a list of tasks which are required after completion of the current task, but reside elsewhere in the database.

Attribute of: TASK

Entity Type Relationships/Constraints: See Section 50.2.4

A FOLLOWON is an entity type.

A FOLLOWON may be REFERENCED-BY any number of TASK's.

A FOLLOWON must be WITH exactly one REFID.

047 GOVSTD - Government Standard

Description: A document that establishes engineering and technical requirements for processes, procedures, practices and methods that has been adopted as a standard. It also establishes requirements for selection, application and design criteria for materials.

Attribute of: CONSUM

Entity Type Relationships/Constraints: See Section 50.2.11

A GOVSTD is an entity type.

A GOVSTD may SPECIFY any number of CONSUM's.

A GOVSTD must be WITH exactly one GOVSTD-CODE.

048 GOVSTD-CODE - A Label Type of GOVSTD

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.11

A GOVSTD-CODE is a label type with representation Alphanumeric 15.

A GOVSTD-CODE may be OF at most one GOVSTD.

049 GRAPHIC - Graphic Element

Description: References an element used to group graphic primitives into a composite graphic. It also supports those transformations needed to be performed on the graphic primitives to scale, rotate, translate, etc. the individual primitives into a composite image.

Attribute of: DESCINFO, PARTINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.13

A GRAPHIC is an entity type.

A GRAPHIC is a subtype of COMMON-ELEMENT.

A GRAPHIC may DISPLAY at most one TEXT.

A GRAPHIC must INVOKE one or more GRPHPRIM's.

A GRAPHIC may be DISPLAYED-BY any number of DESCINFO's.

A GRAPHIC may be DISPLAYED-BY any number of STEP's.

- A GRAPHIC may be FOCUSED BY any number of GRAPGIC's.
- A GRAPHIC may be IDENTIFIED-BY any number of PARTINFO's.
- A GRAPHIC may SPECIFY any number of MINSIZE's.
- A GRAPHIC may SPECIFY at most one PENPATT.
- A GRAPHIC may SPECIFY at most one PENSHAPE.
- A GRAPHIC may SPECIFY any number of TRANSFRM's.
- A GRAPHIC may SPECIFY any number of WINDOW's.
- A GRAPHIC may SPECIFY FOCUS any number of GRAPHIC's.

050 GRPHPRIM - Graphic Primitive

Description: References a single graphic component, which when combined with other primitives, can become a composite graphic. A graphic primitive references a file which contains the detailed graphic information in the form of CGM, IGES, FAX, or DXF graphic codes.

Attribute of: GRAPHIC

Entity Type Relationships/Constraints: See Section 50.2.14

- A GRPHPRIM is an entity type.
- A GRPHPRIM is a subtype of COMMON-ELEMENT.
- A GRPHPRIM may CONTAIN at most one PCDATA.
- A GRPHPRIM may DISPLAY at most one TEXT.
- A GRPHPRIM may be INVOKED-BY any number of GRAPHIC's.
- A GRPHPRIM may be INVOKED-BY any number of FOCUS's.
- A GRPHPRIM may REFER-TO at most one FILE.
- A GRPHPRIM may SPECIFY at most one CODING.
- A GRPHPRIM may SPECIFY any number of MINSIZE's.
- A GRPHPRIM may SPECIFY at most one PENPATT.
- A GRPHPRIM may SPECIFY at most one PENSHAPE.
- A GRPHPRIM may SPECIFY at most one START.
- A GRPHPRIM may SPECIFY at most one STOP.
- A GRPHPRIM may SPECIFY any number of TRANSFRM's.
- A GRPHPRIM may SPECIFY any number of WINDOW's.

051 HCI - Hardness Critical Index

Description: Indicates that a particular piece of equipment has nuclear survivability requirements which cannot be degraded during maintenance and operation.

Attribute of: PARTBASE

Entity Type Relationships/Constraints: See Section 50.2.18

- A HCI is an entity type.
- A HCI may be OF any number of PARTBASE's.
- A HCI must be WITH exactly one HCI-CODE.

052 HCI-CODE - A Label Type of HCI

Data Format: 1 X F

Label Type Descriptions/Constraints: See Section 50.2.18
A HCI-CODE is a label type with representation Character 1.
A HCI-CODE may be OF at most one HCI.

053 ID - A Label Type of CDM-ELEMENT

Data Format: 15 X L

Description: Designates a unique machine generated identifier for an element.

Attribute of: CDM-ELEMENT

Label Type Descriptions/Constraints: See Section 50.2.1
An ID is a label type with representation Character 15.
An ID may be OF at most one CDM-ELEMENT.

054 INDX-NUMBER - A Label Type of INDXNUM

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.17
An INDX-NUMBER is a label type with representation Alphanumeric 15.
An INDX-NUMBER may be OF at most one INDXNUM.

055 INDXNUM - Index Number

Description: References the maintainers' view of part information. It describes an item in term of its 'refdes' which categorizes parts by their place in the system-subsystem hierarchy.

Attribute of: PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.17
An INDXNUM is an entity type.
An INDXNUM may be REFERRED by any number of PARTINFO's.
An INDXNUM must be WITH exactly one INDX-NUMBER.

056 ITEMID - A Label Type of COMMON-ELEMENT

Data Format: 32 X L

Description: Represents the specific equipment item which is associated with the element it pertains to. It could be a refdes, ssn #, part #, etc. depending on which element it refers to.

Attribute of: COMMON-ELEMENT, PARTBASE

Label Type Descriptions/Constraints: See Section 50.2.2
An ITEMID is a label type with representation Alphanumeric 32.
An ITEMID may be OF any number of COMMON-ELEMENT's.

An ITEMID may be OF any number of PARTBASE's.

Example(s):

task/itemid: "94-50-03"

057 LIST - List Element

Description: References a general purpose element which can be referenced from any element to show a grouping of elements with a common context.

Attribute of: NONE

Entity Type Relationships/Constraints: See Section 50.2.20

A LIST is an entity type.

A LIST is a subtype of CDM-ELEMENT.

A LIST must CONTAIN exactly one CONTEXT.

A LIST must REFER-TO one or more ELMNTREF's.

A LIST may be WITH at most one LIST-NAME.

A LIST must be WITH exactly one REFID.

058 LIST-NAME - A Label Type of LIST

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.20

A LIST-NAME is a label type with representation Alphanumeric 15.

A LIST-NAME may be OF any number of LIST's.

059 MAINT-LEVEL - A Label Type of MAINTLVL

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19

A MAINT-LEVEL is a label type with representation Alphanumeric 10.

A MAINT-LEVEL may be OF at most one MAINTLVL.

Example(s):

context/maintlvl: "olevel", or "ilevel"

060 MAINTLVL - Maintenance Level

Description: Represents the appropriate maintenance level for repair of an item and helps provide the correct information for that level. Valid levels are: organizational, intermediate, and depot.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A MAINTLVL is an entity type.

A MAINTLVL may be OF any number of CONTEXT's.

A MAINTLVL must be WITH exactly one MAINT-LEVEL.

061 MENU - Menu of Choices

Description: References a type of prompt which is a menu choice. A menu choice consists of a question (text), a property, and a set of possible responses (choices). The user chooses a response, the value associated with the choice selected is asserted for the value of the property associated with the menu.

Attribute of: PROMPT

Entity Type Relationships/Constraints: See Section 50.2.6

- A MENU is an entity type.
- A MENU is a subtype of COMMON-ELEMENT.
- A MENU must ASSERT exactly one PROPERTY.
- A MENU may be CALLED-BY any number of PROMPT's.
- A MENU must DISPLAY exactly one TEXT.
- A MENU must HAVE one or more CHOICE's.
- A MENU may HAVE any number of DEFAULT's.
- A MENU may HAVE at most one SELECT.

062 MFG-CODE - A Label Type of MFGCODE

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19

- A MFG-CODE is a label type with representation Alphanumeric 10.
- A MFG-CODE may be OF at most one MFGCODE.

063 MFGCODE - Manufacturer's Code.

Description: Represents the code a manufacturer uses in-house to represent parts.

Attribute of: CONSUM

Entity Type Relationships/Constraints: See Section 50.2.19

- A MFGCODE is an entity type.
- A MFGCODE may SPECIFY any number of CONSUM's.
- A MFGCODE must be WITH exactly one MFG-CODE.

064 MILSPEC - Military Specification Number.

Description: Represents the exact specification for each item bought by the government.

Attribute of: CONSUM

Entity Type Relationships/Constraints: See Section 50.2.19

- A MILSPEC is an entity type.
- A MILSPEC may SPECIFY any number of CONSUM's.

A MILSPEC must be WITH exactly one MILSPEC-CODE.

065 MILSPEC-CODE - A Label Type of MILSPEC

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19

A MILSPEC-CODE is a label type with representation Alphanumeric 10.

A MILSPEC-CODE may be OF at most one MILSPEC.

066 MINSIZE - Minimum Size

Description: Represents the minimum size required to display a graphic to satisfy the technicians' requirements. The size of the image should be provided in the minimum number of minutes of arc, which must be subtended by the image on the user's eye to make the graphic readable to the user.

Attribute of: GRAPHIC, GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.13

A MINSIZE is an entity type.

A MINSIZE may be SPECIFIED-BY any number of GRPHPRIM's.

A MINSIZE may be SPECIFIED-BY any number of GRAPHIC's.

A MINSIZE must be WITH exactly one MINSIZE-CODE.

A MINSIZE-CODE may be OF at most one MINSIZE.

067 MINSIZE-CODE - A Label Type of MINSIZE

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.13

A MINSIZE-CODE is a label type with representation Numeric 10.

A MINSIZE-CODE be OF at most one MINSIZE.

068 MTBF - Mean Time Between Failure

Description: Represents the average time a specific part or system should work between failures.

Attribute of: FAULT, PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.17

A MTBF is an entity type.

A MTBF may be OF any number of FAULT's.

A MTBF may be OF any number of PARTINFO's.

A MTBF must be WITH exactly one MTBF-TIME.

069 MTBF-TIME - A Label Type of MTBF

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.17
A MTBF-TIME is a label type with representation Numeric 10.
A MTBF-TIME may be OF at most one MTBF.

070 NAME - A Label Type of COMMON-ELEMENT

Data Format: 80 X L

Description: Represents the textual name or title of an element.

Attribute of: COMMON-ELEMENT, PARTBASE

Label Type Descriptions/Constraints: See Section 50.2.2
A NAME is a label type with representation Alphanumeric 80.
A NAME may be OF any number of COMMON-ELEMENT's.
A NAME may be OF at most one PARTBASE.

071 NOTE - Note

Description: References additional information to aid the technician in completing a given step. A NOTE is used in technical information to emphasize an especially important procedure or condition.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.5
A NOTE is an entity type.
A NOTE is a subtype of COMMON-ELEMENT.
A NOTE must DISPLAY exactly one TEXT.
A NOTE may be REFERENCED-BY any number of STEP's.
A NOTE may be REFERENCED-BY any number of TASK's.

072 NOUNID - A Label Type of PARTINFO

Data Format: 80 X L

Description: Represents a general name of a part.

Attribute of: PARTINFO

Label Type Descriptions/Constraints: See Section 50.2.17
A NOUNID is a label type with representation Alphanumeric 80.
A NOUNID may be OF any number of PARTINFO's.

073 NOUNTYPE - A Label Type of PARTINFO

Data Format: 80 X L

Description: Represents more specific descriptors which differentiate part names.

Attribute of: PARTINFO

Label Type Descriptions/Constraints: See Section 50.2.17
A NOUNTYPE is a label type with representation Alphanumeric 80.
A NOUNTYPE may be OF any number of PARTINFO's.

074 NSN - A Label Type of PARTBASE

Data Format: 20 X L

Description: The NSN is assigned under the Federal Cataloguing Program and/or NATO codification of equipment system to each approved item identification to provide an unique identification of an item of supply within a specified Federal Supply Classification (FSC). The field consists of a three-character prefix, a thirteen-characters National Stock Number (NSN), and a four-character suffix code. For applicable, see DoD 4100.38-M.

Attribute of: PARTBASE

Label Type Descriptions/Constraints: See Section 50.2.18
A NSN is a label type with representation Alphanumeric 20.
A NSN may be OF at most one PARTBASE.

075 NUMBER - A Label Type of QTY

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.4
A NUMBER is a label type with representation Numeric 10.
A NUMBER may be OF at most one QTY.

076 OP - Operator

Description: Represents the operator within a comparison between a property and a value.

Attribute of: PRECOND

Entity Type Relationships/Constraints: See Section 50.2.7
An OP is an entity type.
An OP may be OF any number of PRECOND's.
An OP must be WITH exactly one OP-DATA.

077 OP-DATA - A Label Type of OP

Data Format: 3 A L

Label Type Descriptions/Constraints: See Section 50.2.7
An OP-DATA is a label type with representation Character 3.
An OP-DATA may be OF at most one OP.

Example(s): "eq", "lt", "lte", "gt", "gte", or "in".

078 OPERINFO - Operational information

Description: References procedural task information and descriptive information required for operating the system in question.

Attribute of: SYSTEM

Entity Type Relationships/Constraints: See Section 50.2.3

An OPERINFO is an entity type.

An OPERINFO is a subtype of COMMON-ELEMENT.

An OPERINFO may be REFERENCED-BY any number of SYSTEM's.

An OPERINFO may REFER-TO any number of DESCINFO's.

An OPERINFO may REFER-TO any number of TASK's.

079 OUTCOME - Test outcome

Description: References the implicated and exculpated fault states known to be true following a specific test outcome.

Attribute of: TEST

Entity Type Relationships/Constraints: See Section 50.2.15

An OUTCOME is an entity type.

An OUTCOME is a subtype of COMMON-ELEMENT.

An OUTCOME may DISPLAY at most one TEXT.

An OUTCOME must IDENTIFY one or more FLTSTATE's.

An OUTCOME may be PRODUCED-BY any number of TEST's.

An OUTCOME must TEST one or more PRECOND's.

080 PARTBASE - Part Base

Description: References the information about a part that does not change with respect to the place it is used on the vehicle. It represents the supply systems view of part information.

Attribute of: PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.18

A PARTBASE is an entity type.

A PARTBASE is a subtype of CDM-ELEMENT.

A PARTBASE must CONTAIN exactly one HCI.

A PARTBASE must CONTAIN exactly one SMR.

A PARTBASE may CONTAIN at most one TYPE.

A PARTBASE may be IDENTIFIED-BY any number of PARTINFO's.

A PARTBASE must MADE-BY exactly one CAGE.

A PARTBASE may REFER any number of XREF's.

A PARTBASE may be WITH at most one ITEMID.

A PARTBASE may be WITH at most one NAME.

A PARTBASE must be WITH exactly one NSN.

A PARTBASE must be WITH exactly one PARTNUM.

A PARTBASE must be WITH exactly one REFID.

081 PARTINFO - Part Information

Description: References a part in terms of its reference designator, which categorizes parts by their place in the system-subsystem hierarchy. It represents the maintainers' view of part information.

Attribute of: FAULT, SYSTEM

Entity Type Relationships/Constraints: See Section 50.2.17

- A PARTINFO is an entity type.
- A PARTINFO is a subtype of COMMON-ELEMENT.
- A PARTINFO must HAVE exactly one MTBF.
- A PARTINFO must IDENTIFY one or more GRAPHIC's.
- A PARTINFO must IDENTIFY one or more PARTBASE's.
- A PARTINFO may IDENTIFY at most one REPLVL.
- A PARTINFO may be IDENTIFIED-BY any number of SYSTEM's.
- A PARTINFO must BE-IDENTIFIED-BY exactly one USABLON.
- A PARTINFO may be POINTED-TO-BY any number of FAULT's.
- A PARTINFO must BE-REFERENCED-BY exactly one INDXNUM.
- A PARTINFO must REQUIRE exactly one UNITSPER.
- A PARTINFO may be WITH at most one NOUNID.
- A PARTINFO may be WITH at most one NOUNTYPE.
- A PARTINFO must be WITH exactly one REFDES.

082 PARTNUM - Part Number

Data Format: 32 X L

Description: Represents the part number assigned to an item by the supply system.

Attribute of: PARTBASE

Label Type Descriptions/Constraints: See Section 50.2.18

- A PARTNUM is a label type with representation Alphanumeric 32.
- A PARTNUM may be OF any number of PARTBASE's.

083 PCDATA - Text Unit

Description: A text string of parsable character data.

Attribute of: GRPHPRIM, TEXT

Entity Type Relationships/Constraints: See Section 50.2.10

- A PCDATA is an entity type.
- A PCDATA may be CONTAINED-IN any number of GRPHPRIM's.
- A PCDATA may be CONTAINED-IN any number of TEXT's.
- A PCDATA must be WITH exactly one PCTEXT.

084 PCTEXT - A Label Type of PCDATA

Data Format: NARRATIVE

Label Type Descriptions/Constraints: See Section 50.2.10

A PCTEXT is a label type with representation Text 9999.

A PCTEXT may be OF at most one PCDATA.

085 PENPATT - Pen Pattern

Description: Represents the bit map pattern to be used as the pen for drawing lines, points, etc. for a particular graphic.

Attribute of: GRAPHIC, GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.13

A PENPATT is an entity type.

A PENPATT may be SPECIFIED-BY any number of GRPHPRIM's.

A PENPATT may be SPECIFIES-BY any number of GRAPHIC's.

A PENPATT must be WITH exactly one PENPATT-DATA.

086 PENPATT-DATA - A Label Type of PENPATT

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.13

A PENPATT-DATA is a label type with representation Alphanumeric 10.

A PENPATT-DATA may be OF at most one PENPATT.

087 PENSHAPE - Pen shape

Description: Represents the boundary shape for the pen for drawing lines, points, etc. for a particular graphic.

Attribute of: GRAPHIC, GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.13

A PENSHAPE is an entity type.

A PENSHAPE may be SPECIFIED-BY any number of GRAPHIC's.

A PENSHAPE may be SPECIFIED-BY any number of GRPHPRIM's.

A PENSHAPE must be WITH exactly one PENSHAPE-DATA.

088 PENSHAPE-DATA - A Label Type of PENSHAPE

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.13

A PENSHAPE-DATA is a label type with representation Alphanumeric 10.

A PENSHAPE-DATA may be OF at most one PENSHAPE.

089 PERSON - Personnel Required

Description: References the number and type of people required to complete a specific step or procedure.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

- A PERSON is an entity type.
- A PERSON is a subtype of COMMON-ELEMENT.
- A PERSON must HAVE exactly one QTY.
- A PERSON may be REQUIRED-BY any number of STEP's.
- A PERSON may be REQUIRED-BY any number of TASK's.

090 POLARITY - Logical Polarity

Description: Represents the logical polarity (positive or negative) of a property-value pair for an assertion or precondition. A negative polarity is equivalent to saying that the property-value pair is not true for the assertion or precondition.

Attribute of: PRECOND

Entity Type Relationships/Constraints: See Section 50.2.7

- A POLARITY is an entity type.
- A POLARITY may be OF any number of PRECOND's.
- A POLARITY must be WITH exactly one POLARITY-DATA.

091 POLARITY-DATA - A Label Type of POLARITY

Data Format: 3 A L

Label Type Descriptions/Constraints: See Section 50.2.7

- A POLARITY-DATA is a label type with representation Character 3.
- A POLARITY-DATA may be OF at most one POLARITY.

Example(s): "pos" or "neg".

092 PRECOND - Precondition

Description: States a property-operation-value condition or relation which must be true for its associated data to be applicable to the current context, troubleshooting outcome, or required condition.

Attribute of: CONTEXT, OUTCOME, REQCOND

Entity Type Relationships/Constraints: See Section 50.2.7

- A PRECOND is an entity type.
- A PRECOND is a subtype of CDM-ELEMENT.
- A PRECOND may CONTAIN at most one OP.
- A PRECOND may CONTAIN at most one POLARITY.
- A PRECOND may be TESTED-BY any number of CONTEXT's.
- A PRECOND may be TESTED-BY any number of OUTCOME's.
- A PRECOND may be TESTED-BY any number of REQCOND's.
- A PRECOND must TEST exactly one PROPERTY.

A PRECOND must TEST one or more VALUE's.

093 PROCESS - Software Process

Description: References an external software process (a file, a 1553 instruction, a software program, etc.).

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.9

A PROCESS is an entity type.

A PROCESS is a subtype of COMMON-ELEMENT.

A PROCESS may be INVOKED-BY any number of DESCINFO's.

A PROCESS may be INVOKED-BY any number of STEP's.

A PROCESS may REFER-TO at most one EXREFID.

A PROCESS may REFER-TO at most one FILE.

094 PROMPT - User Input Prompt

Description: References a fill-in or menu question, which the system cannot assert itself, to the user. Each prompt is associated with a 'property' which specifies the property which will be asserted, along with the user's response when the prompt is answered.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.6

A PROMPT is an entity type.

A PROMPT is a subtype of COMMON-ELEMENT.

A PROMPT may CALL any number of MENU's.

A PROMPT may CONTAIN any number of FILLIN's.

A PROMPT may DISPLAY at most one TEXT.

A PROMPT may be PRESENTED-BY any number of DESCINFO's.

A PROMPT may be PRESENTED-BY any number of STEP's.

095 PROPERTY - Property

Description: References any text string which defines a property. At runtime, property-value pairs may be asserted or tested by the software.

Attribute of: ASSERTION, FILLIN, MENU, PRECOND

Entity Type Relationships/Constraints: See Section 50.2.8

A PROPERTY is an entity type.

A PROPERTY is a subtype of CDM-ELEMENT.

A PROPERTY must DISPLAY exactly one TEXT.

A PROPERTY may be ASSERTED-BY any number of ASSERTION's.

A PROPERTY may be ASSERTED-BY any number of FILLIN's.

A PROPERTY may be ASSERTED-BY any number of MENU's.

A PROPERTY may be TESTED-BY any number of PRECOND's.

A PROPERTY may REFER-TO at most one ELMNTREF.

096 QTY - Quantity

Description: Specifies the amount of the appropriate consumable required for the associated task/step.

Attribute of: COMSUM, EQUIP, PERSON

Entity Type Relationships/Constraints: See Section 50.2.4

- A QTY is an entity type.
- A QTY may be OF any number of CONSUM's.
- A QTY may be OF any number of EQUIP's.
- A QTY may be OF any number of PERSON's.
- A QTY must be WITH exactly one NUMBER.

097 RANGE - Range of Values

Description: Specifies the boundaries for valid choices or outcomes according to the element containing the range.

Attribute of: FILLIN, TEST

Entity Type Relationships/Constraints: See Section 50.2.15

- A RANGE is an entity type.
- A RANGE may be OF any number of FILLIN's.
- A RANGE may REPRESENT any number of TEST's.
- A RANGE must be WITH exactly one RANGE-DATA.

098 RANGE-DATA - A Label Type of RANGE

Data Format: 80 X L

Label Type Descriptions/Constraints: See Section 50.2.15

- A RANGE-DATA is a label type with representation Alphanumeric 80.
- A RANGE-DATA may be OF at most one RANGE.

099 RECT - Rectification

Description: References the repair procedures necessary to fix an associated fault. They also point to tests, which are usually checkout tasks to verify that the rectification was successful. Also, it has a fault attribute used to identify all the faults repaired by the rectification.

Attribute of: FAULT

Entity Type Relationships/Constraints: See Section 50.2.16

- A RECT is an entity type.
- A RECT is a subtype of COMMON-ELEMENT.
- A RECT may DISPLAY at most one TEXT.
- A RECT may IDENTIFY at most one ACTION.

A RECT must IDENTIFY one or more TASK's.
A RECT may IDENTIFY any number of TEST's.
A RECT may be IDENTIFIED-BY any number of FAULT's.
A RECT may be PERFORMED-BY at most one AGENT.

100 REFDES - Reference Designator

Data Format: 10 X L

Description: Specifies an identifier given to a part to show its place in the system architecture the maintainer sees.

Attribute of: PARTINFO

Label Type Descriptions/Constraints: See Section 50.2.17

A REFDES is a label type with representation Alphanumeric 10.

A REFDES may be OF at most one PARTINFO.

101 REFID - A Label Type of COMMON-ELEMENT

Data Format: 10 X L

Description: Designates a non-unique reference identifier for an element. If there are a number of elements which can be used interchangeably (the particular element to be used is selected by "CONTEXT"), then all of these interchangeable elements would have the same REFID.

Attribute of: COMMON-ELEMENT, LIST, PARTBASE

Label Type Descriptions/Constraints: See Section 50.2.2

A REFID is a label type with representation Alphanumeric 10.

A REFID may be OF any number of COMMON-ELEMENT's.

A REFID may be OF at most one FOLLOWON.

A REFID may be OF any number of LIST's.

A REFID may be OF any number of PARTBASE's.

102 RELATION - Related to Cross Reference

Description: Specifies a text string used to describe the nature of the cross reference (theory, schematic, etc.).

Attribute of: XREF

Entity Type Relationships/Constraints: See Section 50.2.20

A RELATION is an entity type.

A RELATION may be CONTAINED-IN any number of XREF's.

A RELATION must be WITH exactly one RELATION-DATA.

103 RELATION-DATA - A Label Type of RELATION

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.20

A RELATION-DATA is a label type with representation Alphanumeric 10.

A RELATION-DATA may be OF at most one RELATION.

104 RELEASE - Release Specification

Description: Specifies in which countries the document may be released.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A RELEASE is an entity type.

A RELEASE may be OF any number of CONTEXT's.

A RELEASE must be WITH exactly one RELEASE-CODE.

105 RELEASE-CODE - A Label Type of RELEASE

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19

A RELEASE-CODE is a label type with representation Alphanumeric 10.

A RELEASE-CODE may be OF at most one RELEASE.

106 REP-LEVEL - A Label Type of REPLVL

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.17

A REP-LEVEL is a label type with representation Alphanumeric 10.

A REP-LEVEL may be OF at most one REPLVL.

107 REPLVL - Replenishment Level

Description: Represents the minimum quantity of a part in stock, which will trigger a reorder or stock action.

Attribute of: PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.17

A REPLVL is an entity type.

A REPLVL may be IDENTIFIED-BY any number of PARTINFO's.

A REPLVL must be WITH exactly one REP-LEVEL.

108 REQCOND - Required Condition

Description: References a list of preliminary conditions which must be satisfied before performing a step or step sequence.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

A REQCOND is an entity type.

A REQCOND is a subtype of COMMON-ELEMENT.

A REQCOND may be TESTED-BY any number of STEP's.

A REQCOND may be TESTED-BY any number of TASK's.

A REQCOND may REFER-TO any number of ELMNTREF's.

A REQCOND may TEST any number of PRECOND's.

109 ROW - Row of a Table

Description: Represents a particular row in a table.

Attribute of: ENTRY

Entity Type Relationships/Constraints: See Section 50.2.12

A ROW is an entity type.

A ROW may be CONTAINED-IN any number of ENTRY's.

A ROW must be WITH exactly one ROW-NUMBER.

110 ROW-NUMBER - A Label Type of ROW

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.12

A ROW-NUMBER is a label type with representation Numeric 10.

A ROW-NUMBER may be OF at most one ROW.

111 SECURITY - Security Classification

Description: Specifies the security level of the information.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A SECURITY is an entity type.

A SECURITY may be OF any number of CONTEXT's.

A SECURITY must be WITH exactly one SECURITY-CODE.

112 SECURITY-CODE - A Label Type of SECURITY

Data Format: 10 A L

Label Type Descriptions/Constraints: See Section 50.2.19

A SECURITY-CODE is a label type with representation Character 10.

A SECURITY-CODE may be OF at most one SECURITY.

Example(s): "uc", "c", "s", or "ts".

113 SELECT - Number of Selections on a menu

Description: Represents either a single selection or multiple selection of choices from a menu element.

Attribute of: MENU

Entity Type Relationships/Constraints: See Section 50.2.6

A SELECT is an entity type.

A SELECT may be OF any number of MENU's.

A SELECT must be WITH exactly one SELECT-DATA.

114 SELECT-DATA - A Label Type of SELECT

Data Format: 1 A F

Label Type Descriptions/Constraints: See Section 50.2.6

A SELECT-DATA is a label type with representation Character 1.

A SELECT-DATA may be OF at most one SELECT.

Example(s): "single" or "multiple"

115 SMR - Source Maintenance Reliability Code

Description: Represents the code used to identify how recoverable a part is (recyclable, o-level, i-level, replace, etc.).

Attribute of: PARTBASE

Entity Type Relationships/Constraints: See Section 50.2.18

A SMR is an entity type.

A SMR may be OF any number of PARTBASE's.

A SMR must be WITH exactly one SMR-CODE.

116 SMR-CODE - A Label Type of SMR

Data Format: 6 X L

Label Type Descriptions/Constraints: See Section 50.2.18

A SMR-CODE is a label type with representation Alphanumeric 6.

A SMR-CODE may be OF at most one SMR.

117 START - Starting Point in a Graphics File

Description: Identifies a location within a graphic file where the presentation system should start reading graphics codes for the specific graphic being presented.

Attribute of: GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.14

A START is an entity type.

A START may be SPECIFIED-BY any number of GRPHPRIM's.

A START must be WITH exactly one STOP-DATA.

118 START-DATA - A Label Type of START

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.14

A START-DATA is a label type with representation Alphanumeric 15.

A START-DATA may be OF at most one START.

119 STEP - Task Step

Description: References a procedural step within a task.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.5

A STEP is an entity type.

A STEP is a subtype of COMMON-ELEMENT.

A STEP may ASSERT any number of ASSERTION's.

A STEP may CONTAIN any number of ANNOT's.

A STEP may DISPLAY any number of GRAPHIC's.

A STEP must DISPLAY exactly one TEXT.

A STEP may INVOKE any number of AUDIO's.

A STEP may INVOKE any number of PROCESS's.

A STEP may INVOKE any number of VIDEO's.

A STEP may be SUB-STEP-OF any number of STEP's.

A STEP may be REFERENCED-BY any number of TASK's.

A STEP may PRESENT any number of PROMPT's.

A STEP may PRESENT any number of TABLE's.

A STEP may REFER-TO any number of CAUTION's.

A STEP may REFER-TO any number of NOTE's.

A STEP may be SUB-STEP-OF any number of STEP's.

A STEP may REFER-TO any number of WARNING's.

A STEP may REQUIRE any number of CONSUM's.

A STEP may REQUIRE any number of EQUIP's.

A STEP may REQUIRE at most one ESTTIME.

A STEP may REQUIRE any number of PERSON's.

A STEP may TEST any number of REQCOND's.

A STEP may USE any number of VERB's.

120 STOP - Stopping Point in a Graphics File

Description: Identifies a location within a graphic file where the presentation system should stop reading graphics codes for the specific graphic being presented.

Attribute of: GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.14

A STOP is an entity type.

A STOP may be SPECIFIED-BY any number of GRPHPRIM's.

A STOP must be WITH exactly one STOP-DATA.

121 STOP-DATA - A Label Type of STOP

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.14

A STOP-DATA is a label type with representation Alphanumeric 15.

A STOP-DATA may be OF at most one START.

A STOP-DATA may be OF at most one STOP.

122 SYSTEM - System

Description: References a vehicle, system, subsystem, or subassembly element in the equipment hierarchy. A SYSTEM may reference procedural task information, descriptive information, parts information, fault information, or operational information.

Attribute of: SYSTEM

Entity Type Relationships/Constraints: See Section 50.2.3

A SYSTEM is an entity type.

A SYSTEM is a subtype of COMMON-ELEMENT.

A SYSTEM may IDENTIFY any number of PARTINFO's.

A SYSTEM may be SUB-SYSTEM-OF any number of SYSTEM's.

A SYSTEM may REFER-TO any number of DESCINFO's.

A SYSTEM may REFER-TO any number of FAULTINF's.

A SYSTEM may REFER-TO any number of OPERINFO's.

A SYSTEM may REFER-TO any number of SYSTEM's.

A SYSTEM may REFER-TO any number of TASK's.

123 TABLE - Tabular Information

Description: References the components required to construct a table or chart.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.12

A TABLE is an entity type.

A TABLE is a subtype of COMMON-ELEMENT.

A TABLE must CONTAIN one or more COLHDDEF's.

A TABLE must CONTAIN one or more ENTRY's.

A TABLE may be PRESENTED-BY any number of DESCINFO's.

A TABLE may be PRESENTED-BY any number of STEP's.

124 TASK - Task

Description: Specifies a task as a set of directive steps which make up a specific maintenance procedure. A maintenance procedure could be a preventive or corrective maintenance task. A procedural task is composed of STEPs, and connects all text, graphics, messages, prompts, and references required to convey the step together.

Attribute of: OPERINFO, RECT, SYSTEM, TEST

Entity Type Relationships/Constraints: See Section 50.2.4

- A TASK is an entity type.
- A TASK is a subtype of COMMON-ELEMENT.
- A TASK may be IDENTIFIED any number of RECT's.
- A TASK may be IDENTIFIED-BY any number of TEST's.
- A TASK may be REFERENCED-BY any number of OPERINFO's.
- A TASK may be REFERENCED-BY any number of SYSTEM's.
- A TASK may REFER-TO any number of CAUTION's.
- A TASK may REFER-TO any number of FOLLOWON's.
- A TASK may REFER-TO any number of NOTE's.
- A TASK must REFER-TO one or more STEP's.
- A TASK may REFER-TO any number of WARNING's.
- A TASK may REQUIRE any number of CONSUM's.
- A TASK may REQUIRE any number of EQUIP's.
- A TASK may REQUIRE at most one ESTTIME.
- A TASK may REQUIRE any number of PERSON's.
- A TASK may TEST any number of REQCOND's.
- A TASK may USE any number of VERB's.

125 TECHINFO - Technical Information

Description: References all elements. It is the top level of the CDM.

Attribute of: CDM-ELEMENT

Entity Type Relationships/Constraints: See Section 50.2.3

- A TECHINFO is an entity type.
- A TECHINFO is a subtype of COMMON-ELEMENT.
- A TECHINFO may CONTAIN any number of SYSTEM's.

126 TEST - Fault Isolation Test

Description: References a diagnostic test used to guide the technician toward a rectification during troubleshooting.

Attribute of: FAULTINF, FLTSTATE, RECT

Entity Type Relationships/Constraints: See Section 50.2.15

- A TEST is an entity type.
- A TEST is a subtype of COMMON-ELEMENT.
- A TEST may DISPLAY at most one TEXT.
- A TEST must IDENTIFY one or more TASK's.
- A TEST may be IDENTIFIED-BY any number of FAULTINF's.
- A TEST may be IDENTIFIED-BY any number of FLTSTATE's.
- A TEST may be IDENTIFIED-BY any number of RECT's.
- A TEST may be PERFORMED-BY at most one AGENT.
- A TEST may be REPRESENTED-BY at most one RANGE.
- A TEST must PRODUCE one or more OUTCOME's.

127 TEXT - Text

Description: Represents a text string of parsable character data.
This can be a letter, number, word, sentence, paragraph, etc.

Attribute of: ANNOT, CAUTION, CHOICE, DESCINFO, ENTRY, FAULT,
FILLIN, FLTSTATE, GRAPHIC, GRPHPRIM, MENU, NOTE, OUTCOME, PROMPT,
PROPERTY, RECT, STEP, TEST, VALUE, WARNING

Entity Type Relationships/Constraints: See Section 50.2.10

- A TEXT is an entity type.
- A TEXT is a subtype of COMMON-ELEMENT.
- A TEXT may CONTAIN one or more ATTVALUE.
- A TEXT may CONTAIN one or more PCDATA.
- A TEXT may be DISPLAYED-BY any number of GRAPHIC's.
- A TEXT may be DISPLAYED-BY any number of ANNOT's.
- A TEXT may be DISPLAYED-BY any number of CAUTION's.
- A TEXT may be DISPLAYED-BY any number of CHOICE's.
- A TEXT may be DISPLAYED-BY any number of DESCINFO's.
- A TEXT may be DISPLAYED-BY any number of ENTRY's.
- A TEXT may be DISPLAYED-BY any number of FAULT's.
- A TEXT may be DISPLAYED-BY any number of FILLIN's.
- A TEXT may be DISPLAYED-BY any number of FLTSTATE's.
- A TEXT may be DISPLAYED-BY any number of GRAPHIC's.
- A TEXT may be DISPLAYED-BY any number of GRPHPRIM's.
- A TEXT may be DISPLAYED-BY any number of MENU's.
- A TEXT may be DISPLAYED-BY any number of NOTE's.
- A TEXT may be DISPLAYED-BY any number of OUTCOME's.
- A TEXT may be DISPLAYED-BY any number of PROMPT's.
- A TEXT may be DISPLAYED-BY any number of PROPERTY's.
- A TEXT may be DISPLAYED-BY any number of RECT's.
- A TEXT may be DISPLAYED-BY any number of STEP's.
- A TEXT may be DISPLAYED-BY any number of TEST's.
- A TEXT may be DISPLAYED-BY any number of VALUE's.
- A TEXT may be DISPLAYED-BY any number of WARNING's.

All TEXT's must CONTAIN a PCDATA or must CONTAIN an ATTVALUE.

128 TIME - A Label Type of ESTTIME

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.4

- A TIME is a label type with representation Numeric 10.
- A TIME may be OF at most one ESTTIME.

129 TRACK - Track Designation

Description: Represents the skill level appropriate for the
information the technician wants/requires in traversing the data,
(either Expert or Novice).

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A TRACK is an entity type.
A TRACK may be OF any number of CONTEXT's.
A TRACK must be WITH exactly one TRACK-DATA.

130 TRACK-DATA - A Label Type of TRACK

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19
A TRACK-DATA is a label type with representation Alphanumeric 10.
A TRACK-DATA may be OF at most one TRACK.

131 TRANSF-DATA - A Label Type of TRANSFRM

Data Format: 9 N R

Label Type Descriptions/Constraints: See Section 50.2.13
A TRANSF-DATA is a label type with representation Numeric 9.
A TRANSF-DATA may be OF at most one TRANSFRM.

132 TRANSFRM - Transformation Matrix

Description: Represents a transformation matrix which specifies coordinate translations, scalings, reflection, and rotation in terms of homogeneous coordinates.

Attribute of: GRAPHIC, GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.13
A TRANSFRM is an entity type.
A TRANSFRM may be SPECIFIED-BY any number of GRAPHIC's.
A TRANSFRM may be SPECIFIED-BY any number of GRPHPRIM's.
A TRANSFRM must be WITH exactly one TRANSF-DATA.

133 TYPE - Element Type

Description: Represents a unique quality of an element.

Attribute of: COMMON-ELEMENT, COLHDDEF, PARTBASE

Entity Type Relationships/Constraints: See Section 50.2.12
A TYPE is an entity type.
A TYPE may be CONTAINED-IN any number of COLHDDEF's.
A TYPE may be CONTAINED-IN any number of COMMON-ELEMENT's.
A TYPE may be CONTAINED-IN any number of PARTBASE's.
A TYPE must be WITH exactly one TYPE-DATA.

134 TYPE-DATA - A Label Type of TYPE

Data Format: 80 X L

Label Type Descriptions/Constraints: See Section 50.2.12

A TYPE-DATA is a label type with representation Alphanumeric 80.
A TYPE-DATA may be OF at most one TYPE.

Example(s):

dictitem/type: "gloss", "abbsym", "symbol", or "other".
graphic/type: "normal", "locat", "overlay", "schem", "functblk",
 "wiring", "engin", or "icons"
grphprim/type: "normal", "locat", "overlay", "schem", "functblk",
 "wiring", "engin", or "icons"
system/type: "vehicle", "system" or "subsystem"
task/type: "Electrical Check of Clearing Solenoid"

135 UNITSPER - Units per Assembly, System, etc.

Description: Represents the number of units required per assembly
of a system or component.

Attribute of: PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.17

An UNITSPER is an entity type.

An UNITSPER may be REQUIRED-BY any number of PARTINFO's.

An UNITSPER must be WITH exactly one UNITSPER-NUMBER.

136 UNITSPER-NUMBER - A Label Type of UNITSPER

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.17

An UNITSPER-NUMBER is a label type with representation Alphanumeric 10.

An UNITSPER-NUMBER may be OF at most one UNITSPER.

137 UOM - Unit of Measure

Description: Identifies the type of unit measurement for the
consumables needed for the current application.

Attribute of: CONSUM

Entity Type Relationships/Constraints: See Section 50.2.11

An UOM is an entity type.

An UOM may be MEASURES any number of CONSUM's.

An UOM must be WITH exactly one UOM-UNIT.

138 UOM-UNIT - A Label Type of UOM

Data Format: 15 X L

Label Type Descriptions/Constraints: See Section 50.2.11

An UOM-UNIT is a label type with representation Alphanumeric 15.

An UOM-UNIT may be OF at most one UOM.

139 USABLON - Usable on Code

Description: Represents the different configurations in which a part or assembly may appear within a system or vehicle.

Attribute of: PARTINFO

Entity Type Relationships/Constraints: See Section 50.2.17

An USABLON is an entity type.

An USABLON may IDENTIFY any number of PARTINFO's.

An USABLON must be WITH exactly one USABLON-CODE.

140 USABLON-CODE - A Label Type of USABLON

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.17

An USABLON-CODE is a label type with representation Alphanumeric 10.

An USABLON-CODE may be OF at most one USABLON.

141 USER - User Identifier

Description: Represents a user identification attribute in case the user adds annotations to the data.

Attribute of: ANNOT

Entity Type Relationships/Constraints: See Section 50.2.5

An USER is an entity type.

An USER must be WITH exactly one USER-ID.

An USER may WRITE any number of ANNOT's.

142 USER-ID - A Label Type of USER

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.5

An USER-ID is a label type with representation Alphanumeric 10.

An USER-ID may be OF at most one USER.

143 VALSTAT - Validation Status

Description: Represents whether the information has been validated or not.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A VALSTAT is an entity type.

A VALSTAT may be OF any number of CONTEXT's.

A VALSTAT must be WITH exactly one VALSTAT-DATA.

144 VALSTAT-DATA - A Label Type of VALSTAT

Data Format: 2 A L

Label Type Descriptions/Constraints: See Section 50.2.19

A VALSTAT-DATA is a label type with representation Character 2.

A VALSTAT-DATA may be OF at most one VALSTAT.

145 VALUE - Value

Description: References some value that may be used in a prompt or context situation.

Attribute of: ASSERTION, CHOICE, PRECOND

Entity Type Relationships/Constraints: See Section 50.2.8

A VALUE is an entity type.

A VALUE is a subtype of CDM-ELEMENT.

A VALUE must DISPLAY exactly one TEXT.

A VALUE may be ASSERTED-BY any number of ASSERTION's.

A VALUE may be CONTAINED-IN any number of CHOICE's.

A VALUE may be TESTED-BY any number of PRECOND's.

146 VERB - Verb

Description: References a common verb or action which may be performed within a task or step (e.g. remove, replace, inspect, adjust, align, etc.).

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

A VERB is an entity type.

A VERB is a subtype of COMMON-ELEMENT.

A VERB may be USED-BY any number of STEP's.

A VERB may be USED-BY any number of TASK's.

147 VERSION - Version Number

Description: Represents what document version of the information to traverse while performing maintenance operations.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A VERSION is an entity type.

A VERSION may be OF any number of CONTEXT's.

A VERSION must be WITH exactly one VERSION-DATA.

148 VERSION-DATA - A Label Type of VERSION

Data Format: 10 X L

Label Type Descriptions/Constraints: See Section 50.2.19

A VERSION-DATA is a label type with representation Alphanumeric 10.

A VERSION-DATA may be OF at most one VERSION.

149 VERSTAT - Verification Status

Description: Represents whether the information has been verified or not.

Attribute of: CONTEXT

Entity Type Relationships/Constraints: See Section 50.2.19

A VERSTAT is an entity type.

A VERSTAT may be OF any number of CONTEXT's.

A VERSTAT must be WITH exactly one VERSTAT-DATA.

150 VERSTAT-DATA - A Label Type of VERSTAT

Data Format: 2 A L

Label Type Descriptions/Constraints: See Section 50.2.19

A VERSTAT-DATA is a label type with representation Character 2.

A VERSTAT-DATA may be OF at most one VERSTAT.

151 VIDEO - Video Process

Description: References an external video sequence, whether it be a file or some other external component.

Attribute of: DESCINFO, STEP

Entity Type Relationships/Constraints: See Section 50.2.9

A VIDEO is an entity type.

A VIDEO is a subtype of COMMON-ELEMENT.

A VIDEO may be INVOKED-BY any number of DESCINFO's.

A VIDEO may be INVOKED-BY any number of STEP's.

A VIDEO may REFER-TO at most one EXREFID.

A VIDEO may REFER-TO at most one FILE.

152 WARNING - Warning

Description: References a warning that is associated with the task/step which pointed to it. A warning notifies the technician that the task or step may be harmful to himself or another human if not properly performed.

Attribute of: STEP, TASK

Entity Type Relationships/Constraints: See Section 50.2.4

A WARNING is an entity type.

A WARNING is a subtype of COMMON-ELEMENT.

A WARNING must DISPLAY exactly one TEXT.
A WARNING may be REFERENCED-BY any number of STEP's.
A WARNING may be REFERENCED-BY any number of TASK's.

153 WEIGHT - Weighting Factor

Description: Represents a probability associated with a given fault within a list of faults in a fault state.

Attribute of: FLTSTATE

Entity Type Relationships/Constraints: See Section 50.2.16

A WEIGHT is an entity type.

A WEIGHT may be SCALES any number of FLTSTATE's.

A WEIGHT must be WITH exactly one WEIGHT-FACTOR.

154 WEIGHT-FACTOR - A Label Type of WEIGHT

Data Format: 10 N R

Label Type Descriptions/Constraints: See Section 50.2.16

A WEIGHT-FACTOR is a label type with representation Numeric 10.

A WEIGHT-FACTOR may be OF at most one WEIGHT.

155 WINDOW - Graphic Window

Description: Represents the size of a window to be used in clipping an illustration.

Attribute of: GRAPHIC, GRPHPRIM

Entity Type Relationships/Constraints: See Section 50.2.13

A WINDOW is an entity type.

A WINDOW may be SPECIFIED-BY any number of GRAPHIC's.

A WINDOW may be SPECIFIED-BY any number of GRPHPRIM's.

A WINDOW must be WITH exactly one WINDOW-DATA.

156 WINDOW-DATA - A Label Type of WINDOW

Data Format: 20 N R

Label Type Descriptions/Constraints: See Section 50.2.13

A WINDOW-DATA is a label type with representation Numeric 20.

A WINDOW-DATA may be OF at most one WINDOW.

157 XREF - Cross Reference

Description: References a relational link between any two elements or an element with a file or database object.

Attribute of: COMMON-ELEMENT, PARTBASE

Entity Type Relationships/Constraints: See Section 50.2.20

- A XREF is an entity type.
- A XREF is a subtype of CDM-ELEMENT.
- A XREF may CONTAIN at most one RELATION.
- A XREF may have at most one ATTNAME.
- A XREF may be REFERENCED-BY any number of COMMON-ELEMENT's.
- A XREF may be REFERENCED-BY any number of PARTBASE's.
- A XREF may REFER-TO any number of ELMNTREF's.
- A XREF may REFER-TO at most one EXREFID.

Appendix K - MIL-STD-1388-2B Data Elements Available for CDM Use

110 MIL-STD-1388-2B Data Elements Available for CDM Use

The following is a list of selected MIL-STD-1388-2B data elements pertinent to maintenance technical information useful for CDM. Some of the MIL-STD-1388-2B data elements listed below can be directly associated with CDM as shown in Appendix J. The other data elements listed below which can not be related to the current version of CDM should be considered with respect to the future expansion of CDM. For example, the source date for the calibration of the test equipment is available from LSAR. However, the current version of CDM is unable to use it.

The MIL-STD-1388-2B data elements are listed under their relational tables. The sequence of the relational tables shown below is that of Appendix A of MIL-STD-1388-2B.

XA - End Item Acronym Code Table

| | |

178 Item Name
179 Item code
246 National Stock Number
387 Special Material Content Code
384 Special Maintenance Item code
066 Criticality Code
490 Unit Length, Width and Height
491 Unit Weight

HG - Part Application Provisioning Table

409 Quantity per Assembly
306 Provisioning Technical Document. Selection Code
173 Item Category Code
097 Essentiality Code
381 SMR Code
205 Maintenance Replacement Code
322 Recomm. Minimum System Stock Level
017 Allowance Item Code
018 Allowance Item Quantity

HK - Parts Manual Description Table

432 Technical Manual Number
140 Figure Number
180 Item Number

Appendix L - CDM Data Elements Not Available From MIL-STD-1388-2B

120 CDM Data Elements Not Available From MIL-STD-1388-2B

The following is a list of CDM data elements for which the source data is not available from MIL-STD-1388-2B.

| DED | Data Element Description |
|-----|-----------------------------------|
| 006 | ASSERTION - Assertion |
| 011 | AUDIO - Audio Data |
| 029 | CONTEXT - Effectivity Analysis |
| 041 | FAULTINF - Fault Information Data |
| 049 | GRAPHIC - Graphic Element |
| 061 | MENU - Menu of Choices |
| 094 | PROMPT - User Input Prompt |
| 108 | REQCOND - Required Condition |
| 123 | TABLE - Tabular Information |
| 151 | VIDEO - Video Process |
